to some thing (building, place, or benefice), although indirectly extended to the persons by whom the thing is
sowned or enjoyed.—Writ of privilege, a writ to deliver
a privileged person from custody when arrested in a civil
suit. #Byn. 2. Privilege, Preropative, Exemption, Imminuty, Franchise. Privilege is a right to do or a right
to be excussed or spared from doing or bearing, this right
heing possessed by one or more, but not by all. Privilege is also more loosely used for any special advantage:
as, the privilege, an official right, a right indefeasible on account
of one's character or position: as, the Stuart kings were
continually asserting the royal preropative, but Parliament
resisted any infringement upon its privileges. (See definition of prerogetice.) An exemption is an exception or
excuse from what would otherwise be required: as, exemption from military service, or from submitting to examination; figuratively, exemption from care, from disease,
Immunity is the same as exemption, except that exemption more often expresses the act of authority, and immuhity expresses more of the idea of safety: as, immunity
from harm. A franchise is a sort of freedom; the word
has very exact sonses, covering certain privileges, exemption, or formanticles.

6t. pl. The private parts. Abp. Abbot.—7. In law: (a) That relation between different interests of several persons in the same lands which arises under feudal tenures. All the various estates, less than a fee simple absolute, were regarded as so many parts of entire title, and the persons among whom such partial interests were distributed were said to stand in privity or in privity of estate to each other. If the interests belonging to one of such persons devolved either by act of law, as in the case of his desth intestate, or by act of the parties, as in the case of his desth intestate, or by act of the parties, as in the case of his desth intestate, or by act of the parties, as in the case of his desth intestate, or by act of the parties, as in the case of a conveyance, upon a third person, that person was thereby brought into privity with him and the others. In the former case he was said to be privy in law, in the latter case privy in deed, each of these being only species of privies in estate. Upon the same principle, whenever several leaser estates were carved out of a larger, as by grant of a qualified interest or life estate leaving a remainder or reversion in the grantor, the parties were termed privies. (h) More loosely, since the abrogation of tenure, any joint, separate, ests of several persons in the same lands which the abrogation of tenure, any joint, separate, or successive interest affecting the same realty is deemed to constitute a privity between the is deemed to constitute a privity between the parties in interest. Thus, if B inherita land from A, there is privity of estate between them, and if C inherita the same land from B, the privity extends to him, so that B and C may be both bound in respect to the land by whatever bound A. (c) In the law of obligations, the mutual relationships between contractor and contractee, and either of them and a third person claiming under the contract, which result from the existence of the contract. Thus, if A gives his note to B, and B separately gives his note to C, there is privity of contract between A and B, and also between B and C, but if A gives his note to B, and B indorses it over to C, there is privity of contract among all. probabilitation, probabilist.

The working of the principle known as Probabilism. The meaning of this principle . . . is simply this: when a doubt arises as to the binding force of some divine or human precept in any given case, it is permissible to abandon the opinion in favour of obedience to the law—technically known as "safe" (tata) opinion—for that which favours non-compliance, provided this laxer opinion he "probable." And by "probable" is meant any judgment or opinion based on some reasonable grounds, though with some doubt that the opposite view is perhaps the true one (Gury, Theol. Mor., I. n. 51).

[= F. probabilité = Sp. probabilidad = Pg. probabilidade = It. probabilità, < L. probabilita(t-)s, probability, credibility, crodibility, probabile, probable, credible: see probable. 1. The state or character of being probable; likelihood; appearance of truth; that state of a case or question of fact which results from superior evidence or preponderation of argument on one dence or preponderation of argument on one side, inclining the mind to receive that as the truth, but leaving some room for doubt.

Thus, first traditions were a proof alone, Could we be certain such they were, so known; But, since some flaws in long descent may be, They make not truth, but probability. Dryden, Religio Laici, l. 345.

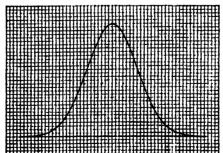

Probability is nothing but the appearance of such an agreement or disagreement, by the intervention of proofs whose connection is not constant, . . . but is or appearance for the most part to be so. . . In which case the foundation of his assent is the probability of the thing, the proof being such as for the most part carries truth with it So that that which causes his assent to this proposition is the wonted veracity of the speaker in other cases.

2. Quantitatively, that character of an argument or proposition of doubtful truth which ment or propositions of arguments are found true in the course of experience. Thus, if a die be thrown, the probability that it will turn up ace is the frequency with which an ace would be turned up in an indefinitely long succession of throws. It is conceivable that there should be no definite probability: thus, the proportion of aces might so fluctuais that their frequency in the long run would be represented by a diverging series. Yet even so, there would be approximate probabilized.

titles for short periods of time. All the essential features of probability are exhibited in the case of patting into a bag some black beans and some white ones, then shaking them well, and finally drawing out one or several at random. The beans must fart be abaken up, so as to assimilate or generalize the contents of the bag; and a similar result must be attained in any case in which probability is to have any real significance. Next, a sample of the beans must be drawn out at random —that is, so as not to be voluntarily subjected to any general conditions additional to those of the course of experience of which they form a part. Thus, out-of-the-way once or uppermost once must not be particularly chosen. This random choice may be effected by machinery, if desired. If, now, a great number of single beans are so taken out and replaced successively, the following phenomenon will be found approximately true, or, if not, a prolongation of the series of drawings will render it so: namely, that if the whole series be separated into parts of two fixed numbers of drawings, say into series of 100 and of 10,000 alternately, then the average proportion of white beans among the sets of 10,000. This is the fundamental proposition of the theory of probabilities—we might say of logic—since the security of all real inference reats upon it. The greater the frequency with which a specific event occurs in the long run, the stronger is the expectation that it will occur in a particular case. Hence, probability has been defined as the degree of belief which ought to be accorded to a probability. Trobability may be measured in different ways. The conceptualistic measure is the degree of confidence to which a reason is entitled; it is used in the measure which is most easily guarded against the fallacles which been the calculation of probability, but a sense of probability. Trobability may be measured in different ways. The conceptualistic measure is the cape of the result of the number of accusions in the course of experience. Thus

of the slope will be remarked. If it is desired to ascertain the probability of the occurrence from k_1 to k_2 times inclusive in π trais of an event whose probable occurrence at each trial is p, the approximate value is the area included between the probability curve, the asymptota, and the two ordinates, for which

$$s = \frac{k_1 - (n+1)p}{\sqrt{2npq}}$$
 and $s = \frac{k_1 + 1 - (n+1)p}{\sqrt{2npq}}$.

Twice the quadratures of the areas are given in treatises on probabilities as tables of the theta function of probabilities. The chief practical application of probability is to insurance; and its only significance lies in an assurance as to the average result in the long run. The theory of probability is to be regarded as the logic of the physical colors. cal science

Antecedent probability. See autecedent.—Balance of probabilities. See balance.—Calculus of probabilities, See balance.—Calculus of probability, a branch of mathematics teaching how to calculate probabilities by general methods.—Curve of probability, see above.—Inverse probability, the probability of a hypothesis as deduced from the comparison of its consequences with observation. Thus, the following is a familiar problem of inverse probability: Supposes a bag contains a series of tickets numbered consecutively from 1 up. Supposes a ticket is drawn at random, and its number is 13, what is the most probable number of tickets in the bag? The best opinion concerning inverse probability seems to be that it is altogether fallactous, unless the antecedent probability of the hypothesis is known. Some writers hold that the probability of a proposition about which we are completely ignorant is 4: others hold that it is indeterminate.—Local probability. See local.—Old Probabilities. See old.

probable (prob'a-bl), a. and n. [< F. probable = Sp. probable = Fg. provacel = It. probable, < L. probabiles, that may be proved, credible, < probare, test, examine: see probe, prove.] I. a. 14. Capable of being proved; provable.

Shak., All's Well, il. 4. 52.

Probable cause. See cause.—Probable error, in astron, and physics. When the value of any quantity or element has been determined by means of a number of independent observations every one liable to a small amount of socidental error, the determination will also be liable to some uncertainty, and the probable error is the quantity which is such that there is the same probability of the difference between the determination and the true absolute value of the thing to be determined exceeding or falling short of it. But it is to be remarked that, as so defined, the constant error belonging to all observations of the given series is not included in the probable error.—Probable evidence, evidence distinguished from demonstrative evidence in that it admits of degrees, and of all variety of them, from the highest moral certainty to the very lowest presumption.—Probable inference. See proposition.—Spn. 2. Presumable, credible, reasonable.

The legs are mostly exserted beyond the common integument of the trunk, and all their joints are extensible in a right line. The teeth are enameled; the incisors are—in the living elephants two above and none below, in some extinct Proboscides none above and two below, or two above and below, any of which may be developed into long traks curving out of the mouth. The feet are all five-toed, so far as is known, incased in broad shallow hoofs, one to each digit, and the palmar and plantar surfaces are padded. The carpal bones are broad and short, in two separate, not interlocking, rows; the scaphoid and lunar are separate from each other; the cuneiform is broad, extended inward, and attached to the ulns; the magnum in front of the lunar; in the hind foot the sateragalus articulates in front only with the navicular. The placenta is deciduate, sonary. The Proboscides belong to the higher or educabilian series of placental mammals. Their nearest living relatives are the Hyrocoldes. There are 2 families—Elephantides, containing the elephants, mammoths, and mastodons, and Disatherides, the dinotheres, the latter all extinct, the former now represented by only 2 living species. 6. In law: (a) The summons, mandate, or command by which a defendant or a thing is brought before the court for litigation: so called as being the primary part of the proceedings, by which the rest is directed. Formerly the superior common-law courts of England, in the case of personal actions, differed greatly in their modes of process; but since the passing of the Process Uniformity Act personal actions in general, except replevin, are begun in the same way in all the English courts—namely, by a writ of summons. In chancery the ordinary process was a writ of subpons. The mode common in probate and ecclesiatical courts is by a citation or summons. In criminal cases, if the accused is not already in custody, the process is usually a writ or warrant. ally a writ or warrant.

4. In law: (a) A writ once issued to warn a defendant in outlawry, or one failing to appear in chancery. (b) In modern public law, usually, if not always, an executive act in writing and duly authenticated, promulgating a command or prohibition which the executive has discretionary power to issue, or a notification of the executive intent in reference to the exediscretionary power to issue, or a notification of the executive intent in reference to the execution of the laws. In early English history positive laws were to some extent made by proclamation, which were usually allowed the force of statutes. The opinion of some that a proclamation usually ceased to operate on a demise of the crown does not seem to be well founded.—Case of proclamations, a noted case in English constitutional history, decided in 1610 (2 How, 8t. Tr., 723, and 12 Coke, 74), upon questions submitted by the lord chancellor and others, wherein it was held "that the king by his proclamation cannot create any offense which was not an offense before"; "that the king hath no prerogative but that which the law of the land allows him"; and that, "if the offense be not punishable in the star-chamber, the prolibition of it by proclamation caused make it punishable there."—Emancipation proclamations. See emencipation.—Fine with proclamations. See emencipation.—Fine with proclamations made by the king and council which did not prejudice estates, offices, libertics, etc., should be obeyed as if made by act of Parliament, and providing for the prosecution and punishment of those who refused to observe such proclamation.—Proclamation of a fine, at common law, the public notice repeatedly to be given of a fine of lands.—Proclamation of neutrality. other things produced in process in support
of the action or defense.—Interdict for production. See interdict, 2.—Syn. 1. Work, performance.—
1 and 2. Produce, Product, Production. Of these only
production may mean the act of producing. As standing
for the thing or things produced, produce applies now
almost exclusively to the raw products or yield of land;
as, to bring fresh produce to market. Where Jonathan
Edwards spoke of regarding "all free actions as the produces of free choice," we should speak now of regarding
them as the products of free choice, or, better, as its effects. There is a lingering use of produce in such expressions as "the produces of a tax," but better now the product,
or, kill better, the proceeds. The word is always collective;
we do not speak of a produce. Product and productions, on
the other hand, are particular. Product is the most gencral of the three words, but expresses the result of some
operation, generally, but not necessarily, physical: as, the
applie is especially an American product; firest Britain exports chiefly manufactured product. Thus, the word may
apply to almost anything where emphasis is laid upon the
fact of its being produced by some cause, especially by
some cause that is named; but, apart from this, the word
is applied chiefly to things having a material value, covering produce, manufactures, etc. Production applies now
almost exclusively to the visible results of the operation of
mind or the handiwork of art, as a book a powen, an oration,
a statue, a painting, a plece of needlework—the act or fact
of producing being only subordinate in mind. Product is
also a technical word of mathematics, but the others are

3. The calling or occupation which one professes to understand and to follow; vocation; desses to understand and to follow; vocation; specifically, a vocation in which a professed knowledge of some department of science or learning is used by its practical application to affairs of others, either in advising, guiding, or teaching them, or in serving their interests or welfare in the practice of an art founded on it. Formerly theology, law, and medicine were specifically known as the professions; but, as the applications of science and learning are extended to other departments of affairs, other vocations also receive the name. The word implies professed attainments in special knowledge, as distinguished from mere skill; a practical dealing with affairs, as distinguished from mere skill; a practical dealing with affairs, as distinguished from mere skill; a practical dealing with affairs, as distinguished from its pursuit for one's own purposes. In professions strictly so called a preliminary examination as to qualifications is usually demanded by law or usage, and a license or other official authority founded thereon required. In law the significance of the word has been contested under statutes imposing axes on persons pursuing any "occupation, trade, or profession," and under statutes authorizing arrest in civil actions for misconduct in a "professional employment"; and it has been, in the former use, held clearly to include the vocation of an attorney, and upon the same principle would obtiess include physicians, unless the mention of trade, etc., in the same clause of the statute be ground for interpreting the statute as relating only to business vocations. Professional employment, in statutes allowing arrest, is regarded as not including a private agency like that of a factor or a real-estate broker, which can be taken up and laid down at pleasure.

8. A public teacher in a university, especially one to whom this title has been formally ly one to whom this title has been formally granted. The title, now the highest that a teacher can receive, appears to have originated in the Italian universities. In tixtord and Cambridge, the professors, and the instruction which they convey by lectures, are only auxiliary instead of principal agents, the routine work of instruction being carried on by the tutors connected with the several colleges. In the universities of Scotland and Germany, on the other hand, the professors are at once the governing body and principal functionaries for the purposes of education. In American universities there is generally a professor at the head of each department of instruction, having often other professors and assistant professors under him. The title is often given, also, to teachers of special branches in secondary schools and locally to principals of common schools (a use derived from the French).

The joints of a tapeworm, for example, are proglottides. This is what makes tapeworms such formidable parasites and so difficult to cradicate. For they are continually budded off from the scolex or "head" (really the whole worm) to the number sometimes of hundreds, like successive links of a chain; such such link or "joint" contains all the sexual elements, and is thus capable itself of starting a new series of the parasites in the eggs it produces. —Byn. 1-4. Progress, Progression, Advance, Advancement, and Proficiency agree in expressing the idea of a forward movement, literally ortiguratively. Proficiency applies only to a person; therest to a person or thing. Progress is a lively word for continued improvement in any respect, or it may mean simply accuracy whether good or evil: as, "The Rake's Progress" (Hogarth). Progression is less common and not general; it emphasizes the act of moving. Progress and advance are high words for the promotion of human knowledge, character, and general welfare. Advancement is essentially synonymous with advance, but is not so general; the word applies chiefly to things mental: as, "The Advancement of Learning" (Baoon); but we speak also of the advancement of luman welfare: here the word suggests the help given by men, viewing it as external, and thus is essentially synonymous with promotion. Advance and progress seem figurative when not physical. Proficiency is the state resulting from having made progress in acquiring either knowledge or skill: as, proficiency in Latin or in music.

Human progress is gradual, by slow degrees, evil by degrees yielding to good, the spiritual succeeding the natural by almost imperceptible processes of amelioration.

the effect of air-remeance, is a paracolar.

The motion of a projectile—that is to say, of a body thrown in any direction and falling under the influence of gravity—was investigated by Gallico.

W. K. Cifford, Lectures, II. 13.

2. Specifically, a missile intended to be projected from a cannon by the explosive force of gunpowder or some similar agent. Projectiles used in smooth-bore guns are usually spherical, though sometimes oblong, as is the case in the Manby, Parrott, and Lyle life-saving projectiles. Projectiles for rifled guns are oblong, the cylindroconoidal form being generally adopted. It is essential for the range and accuracy of such a projectile that it should pass through the air in the direction of its longer axis, and the only certain method of effecting this is to give it a rapid rotary motion about this axis. To this end the projectile must be so prepared that it will engage and follow grooves in the bore of the gun. This is done in several ways: (a) By the fange system, in which the projectile is provided with fianges, studa, or buttons made of a soft metal, as copper, xinc, or brans, which it into the grooves of the bore. (b) By the expansive method, often called the American system, in which the projectile is fitted with an expanding device made of softer material, such as brans, copper, or papier-maché, which is wedged into the grooves by the explosive force of the charge. This system requires more and shallower grooves than the fingne system. Both the preceding methods are applicable to musile-loaders. (c) By the compressive system, in which the projectile is surrounded by a soft metal band or jacket, the diameter of which is greater than that of the bore without the grooves, the projectile being forced into and through the rified part of the bore by the explosive force of the charge. The bands in the bore cut grooves in the encircing bands, which center and give rotation to the projectile, a projectile adapted, by its material and by special methods of hardening its polygroove and shallow, sometimes narrowing toward the musile. This system is in use in breech-loading guna.—Armor-piercing projectile, a projectile adapted, by its material and by special methods of hardening its polygroove and shallow, sometimes nar 2. Specifically, a missile intended to be projected from a cannon by the explosive force of

a oup or disk capable of being forced out to fill the bore a oup or disk capable of being forced out to fill the bore when the gun is discharged. A high initial velocity is obtainable in subcaliber projectiles, for white their weight and hence inertia are much less than those of the full-sized shot, the area soled upon by the expanding gases is the same.—Theory of projectiles, that branch of me chanics which treats of the motion of hodies thrown or driven by an impelling force from the surface of the earth, and affected by gravity and the resistance of the air, as the motion of a cannon- or rife-ball, or of a jet of water, etc. projecting (proj-jek'ting), p. a. Round us throng the grim projections of the heart and of
the brain.

Whitter, Garrison of Cape Ann.

3. That which projects; a part projecting or jutting out, as of a building extending beyond the surface of the wall; a prominence.

The main peculiarity in the outside [of the amphithester at Pola] is to be found in four tower-like projections.

E. A. Freeman, Venice, p. 117.

4. The act of projecting, or scheming or planning: as, he undertook the projection of a new enterprise.

Which, of a weak and niggardly projection,
Doth, like a miser, spoil his coat with scanting
A little cloth.

Shak., Hen. V., ii. 4. 46.

5. (a) In geom., the act or result of constructing rays or right lines through every point of a figure, according to certain rules. These rays are called projecting rays. In central projection, often called projection simply, the projecting rays all pass through one point called the center of projection. In this way a point is projected into a ray, a straight line into a plane. In axial projection, a plane, called a projecting plane, is passed through every point of the figure, all these planes containing one line called the axis of projection. (b) The act or result of construction act or result of constructing rays through evact or result of constructing rays through every point of a figure, all passing through one point, and cutting these rays by a plane or other surface, so as to form a section on that surface which corresponds point for point with the original figure. (c) In chartography, the act or result of constructing a figure upon a plane or other surface, which corresponds point by point with a sphere, spheroid, or other figure; a map-projection (which see, below).—6. See the adjective.—Globular projection. See may projection.—Map-projection, a

gratem of continuous correspondence between the points of a spherical or spheroidal surface and those of a plane, this correspondence determining what points on a map represent given points on the earth, and conversely. Of the systems in use, only a small number are perspective representations (or rather perversions of such representations (or rather perversions of such representations (or rather perversions of such representations), so that the word projection must here be understood in a peculiar technical sense, not implying any simple geometrical relation between the sphere and the plane. The theory of projections is in itself one of the most scientific branches of applied mathematics; it may, indeed, be said to be simply the theory of functions viewed under the strong perspective of a practical standpoint. But only certain parts of the subject, such as the theory of orthomorphic projections, have as yet taken scientific shape. No satisfactory classification of map-projections is known. No satisfactory classification of map-projections are some of the main kinds. The following are the more important: Airy's map-projection. See wap-projection by belease of servers.—Albert's wap-projection, an equivalent map-projection in which the entire sphere appears as the space bounded by two lines and by two arcs of circles having their center at the intersections of these lines, these two arcs representing the infinitesimal parallels about the poles. The other parallels are concentric arcs having the same boundaries, and the meridians are straight lines radiating from the center. This map-projection was invented by H. C. Albers in 1805, and has been used for the map of Europe by Reichard.—Aptenus's wap-projection, a discontinuous map-projection in which the equator orthogonally at equation orthogonally at the same distances as the inner meridians more distant from the center are represented by arcs of circles cutting the equator orthogonally at the same distances as the inner meridians; and the parallels are represente

represented by area of circles outting the equator orthogonally at equilistances, and bisecting the first circle at the points most distant from the equator; but the semi-nridians more distant from the equator; but the semi-nridians more distant from the center are represented by semi-ferices of the same redute as the full circle, and cutting the equator orthogonally at the same distances as the inner merdians is not the parallels are represented by equilibrium the circle, and the parallels are parallels been introduced by Peter Bennewitz or Apianus in 1624—Arayo's map-projection, a map-projection in which one of the merdians is a circle, and the parallels are parallels straight lines dividing the circumference of this circle into equal area, while the orthan merdians are cilipsed dividing the parallels into equal parts. This projection was invented by the French astronomer Arago in 1834. Arrowsendth's map-projection. Bee homolographic map-projection was map-projection. Bee homolographic map-projection in which all the parallels are represented by concentric and equidistant areas of circles, but the contral merdians. These man-projection.—Glaresman's man-projection, a discontinuous man-projection.—Glaresman's man-projection. It was invented by the Swiss mashematician Loriti or Glaresman, and published in 1877.—Globuler man-projection. (a) Any projection of a hemisphere with curvilinear meridians and parallels. (b) A meridional hemispherical man-projection in which the equator is a straight line, the semimeridians are circular area dividing the equator into equal parts, and the parallels are circular area dividing the equator into equal parts, and the parallels are circular area dividing the equator into equal parts, and the parallels are circular area dividing the extreme and central meridians into equal parts. This projection, invented in 1600 by the Italian Nicolosi, has been extensively employed over since. (c) La Hird's map-projection.—Generosic map-projection. This projection was invented by A. Germain.—Irrequiar map-projection. Same as discontinuous map projection.—Isocylindric map-projection an equivalent map-projection the development of a cylinder upon which the sphere has been orthogonally projected. It was invented by the German mathematical philosopher J. H. Lambert.—Isomeric map-projections, the sentitud equivalent map-projection, invented by J. H. Lambert, and the best of the equivalent projections.—Isospherical map-projection. Same as isomeric map-projection in the shape of an eight-pointed star. It was proposed by Jaeger in 1865, and was modified by Petermann.—James's map-projection, a perspective map-projection in which the center of projection is distant from that of the sphere by 1.5 times the radius. It was invented by the English geodesist Sir Henry James.—Lagrange's map-projection, an orthomorphic map-projection in which the sphere is shown a finite number of times on a finite number of sheets, but in which all the north poles (or seniths) coincide, as well as all the south poles (or madirs). The projection was invented by J. H. Lambert, and has been called by many names. It has been used in a government map of Riussia.—La Hire's snap-projection, a perspective projection having the center of projection at a distance from the center of the sphere equal to 1.707 times the radius. This projection, proposed by the French geodesist La Hire in 1701, has been frequently used.—Littrov's map-projection, an orthomorphic projection has two north and two south poles, all four coincident at infinity, and shows the sphere twice on two sheets, which are merely perventions of each other. It has many remarkable properties. It was invented by the Bohemian astronomer Littrow in 1888.—Loryna's map-projection. This projection, invented by the Flemish cosmographer Mercator in 1550, is the most useful of all.—Mericinal snap-projection, amap-projection which seems to be projected upon the plane of a meridian,—Modified Flamsteed's nap-projection. Same as Bessac's map-projection.—Ballesside's map-projection. Bame as homolographic map-projection.—Moliveside's map-projection. Bame as homolographic map-projections, a map-projections, one of three conical map-projections in which the part of the cone of which the map is a reduced development is equal to the spherical zone represented. These were invented by Patrick Murdook in 1788.—Orthographic map-projection, a perspective map-projection from an infinitely distant center.—Orthomorphic map-projection, a map-projection which preserves all angles—that is, the shapes of all infinitesimal portions of the sphere. When one such map-projection has been obtained, say the polar stereographic, which is the simplest, all others may be derived from this by a transformation of the plana. Let r and \(\theta\) be the polar coordinates of any point on the polar stereographic projection, let \(\theta\) denote the imaginary whose aquare is \(-1\), and let \(\theta\) denote the imaginary whose aquare is \(-1\), and let \(\theta\) denote the imaginary whose aquare is \(-1\), and let \(\theta\) denote the imaginary whose aquare is \(-1\), and let \(\theta\) denote the imaginary whose aquare is \(-1\), and let \(\theta\) denote the imaginary whose aquare is \(-1\), and let \(\theta\) denote the imaginary whose aquare is \(-1\), and let \(\theta\) denote the imaginary whose aquare is \(-1\), and let \(\theta\) denote the imaginary whose aquare is \(-1\), and let \(\theta\) denote any function having a differential coefficient. Same as parallelogrammatic map-projection.—Ruysek's map-projection, a conical projection in which the cone cuts the equator and has its vertex at one pole, and the sphere is projected upon the cone by lines perpendicular to the axis. It was invented by Buysch in 1808.—Samer's map-projection. Rame as sameodad map-projection in which the meridians are represented by ellipses cut at equal distances by the parallels. It was proposed by the physicist G. G. Schmidt in 1801.—Sameodad map-projection, an equivalent map-projection which the parallels are equidistant straight lines to which the central meridian is perpendicular. This projection (so called from the form of the meridians) was first used by the French chartographer Sanson in 1830.—Square map-projection, the projection of a map which the successive meridians and parallels out up into squares.—Ste-

noisveus enap-projection, an equivalent projection which represents the whole earth on the sector of a circle, the pole being at the center and the parallels concentric circles. It was invented by J. H. Lambert.—Storographic map-projection, the simplest of all projections, representing the whole aphere once on one infinite plane, the parts at infinity being considered as a point. All circles on the sphere

are represented circles, and the angles are preserved. The stereographic projection of the sphere is a perspective projection, a point on the surface leing the center of projection, but the stereographic map-projection of the spheroid is not a perspective projection. The stereographic projection was known to the sucients, and has always been employed for special purposes.—Textor's map-projection, a modification of the isocylindrical map, by J. C. von Textor, 1908.—Transcers map-projection, a map-projection.—Transcers map-projection, a map-projection in which the space between two meridians and two parallels is represented by a trapssoid, the sides of which are divided proportionally to determine other straight lines representing meridians and parallels.—Werner's map-projection, that equivalent map-projection which has the parallels concentric and equidiatant arcs of circles, with the north pole at the center. The whole sphere has a heart shape. This was invented by Johann Werner, 1814.—Zenthale map-projection, a map-projection which has the parallels concentric and equidiatant arcs of circles, with the north pole at the center. The whole sphere has a heart shape. This was invented by Johann Werner, 1814.—Zenthale map-projection, a map-projection which has the parallels concentric circles.—Mercator's projection. See Mercator's chart (under chart) and Mercator's map-projection (above).—Matural projection, a perspective delineation of a surface on a given plane. Stormanth.—Oblique projection, a projection by means of rays all perpendicular to the plane of projection.—Orthographic projection. See under map-projection. Same as perspective plane (which see, under perspective).—Pow-der of projection, in alchemy, a powder added to base metals in a molten state, and supposed to have the power of transmuting them into gold or silver.—Stereoscopic projection, a double perspective projection adapted to be viewed one part by one eye, the other.

Projective (prō-jek'tiv), a. [projective + «ive.]

projective (pro-jek'tiv), a. [(project + -ive.]
1. Produced by projection.—2. In geom., relating to incidences and coincidences; not metrical: as, a projective theorem or property.—3. Capable, as two plane figures, of being derived

from one another by a number of projections number of projections and sections. Thus, let the plane pencil OABOb be cut by the line AD in the points A, B, C, D, and from the center P let these points be projected into the rays AE, BF, CG, DH, and let these be cut by the line EH in the points E, F, G, H. Then, the range of points EFGH Projective Point is projective with the plane pencil OABCD.—Projective geometry. See geometry that the plane pencil or projective projective visities.

Projective Points

projectivity (pro-jek-tiv'i-ti), s. [< projective + -ity.] The character of being projective, as

In eutom.: (a) The popular name and also the technical specific name of a large silk-spinning moth, Attacus prometheus, or Telea or Callosamia promethea. The male moth is of a dark rich moky or amber hewn, the female of a lighter rusty or reddish brown. In both sexes the wings are crossed by a wavy whitish line near the middle, and have a wide clay-colored border. Near the tips of the fore wings there is an eye-like spot within a bluish-white crescent, and in the female there is an angular reddish-white spot, edged with black, near the middle of each wing. The sega are laid in little clusters of five or six upon twigs in the spring. The larva or worm is delicate bluish-white with a faint pruinescence, with four black tabercles on the thorax. It feeds on ash, sassafras, wild cherry, like, maple, plum, popier, birch, and other trees. The coccon is oblong, dense, grey, and remarkable for the long tough band of silk which suspends it and which is securely wrapped around the supporting twig. Also premethes, premethes,

In all these systems κ , λ , μ , ν , π , ρ , σ , τ , ϕ , and ψ respectively have the same sounds as k, k, m, n, p, r, s, t, t, and ps. The sounds given in parentheses represent the strictor continental pronunciation. γ^2 is γ before γ , κ , ξ , χ (γ^1 being γ claewhere); gh represents the corresponding sonant to th (nearly as German g in Wagen as pronounced by most Germana). In the Modern Greek system χ is ch as in German t, and γ is γ before \tilde{a} and \tilde{c} sounds $(r, \epsilon, etc.)$; $\gamma \kappa$ is ng, $\pi \epsilon$ is nh, and r is nd. The strict continental system and the Modern Greek pronounce by the written accent, while the English and the modified continental secont Greek by the rule for secont in Latin. The two last-named systems generally make c and c long in open syllables (the English pronunciation treating them as c and c in Latin, but v is always long.

C^N and g^N represent c and g before c, s, s, i, and y; c¹ and g¹ represent c and g before other letters than these. The short vowel-sounds are used in the English and in the modified continental system in closed syllables, and the long vowel-sounds in open syllables, regardless of the ancient quantity. The Roman system gives the same quality of sound to a short vowel as to a long, but makes it more rapid in pronunciation. cates wooden brake-ahoes, which, by tightening the chain f, can be made to press strongly against the projecting end of the shaft ε , g, g are stop-reas, which limit the motion of the lever, used only for convenience in applying the brake, and not essential to its action. In the determination of the power transmitted through the ahaft ε , moving in the direction shown by the arrow, the counterpoise is first adjusted to counterbalance the long arm of the lever and the empty scale-pan. The chain f is then tightened and the scale-pan loaded, so that at a given velocity the lever is by the friction of the brake hald away from the rest g, but not in contact with g. Under conditions so established, if L = the perpendicular distance in feet of the point l from the axis of e, B = the weight in pounds placed in the pan, r = the radius in feet or fractions of a foot of the shaft e, and H = the moment of torsion in pounds, then will LB/r = M, and $Sw^*M =$ the power transmitted in foot-pounds during each turn of the winch. 5. In law: (a) The convincing effect of evidence; the manifestation of the truth of a proposition by presenting the reasons for asproposition by presenting the reasons for as-senting to it; such an array of evidence as should determine the judgment of the tribunal in regard to a matter of fact. In criminal cases, to be effectual as proof, the evidence must satisfy beyond a reasonable doubt. In civil cases it is enough that the evidence preponderates.

Evidence is the medium of proof; proof is the effect of vidence.

Judge Dauforth, 108 N. Y., 78.

(b) pl. In equity practice, the instruments of evidence in their documentary form, as depositions, deeds, etc., received in a cause. (c) The evidence in their documentary form, as depositions, deeds, etc., received in a cause. (c) The
presentation of sufficient evidence: as, the burden of proof lies with the plaintiff. Proof is either
written or parole. The former consists of records, deeds,
or other writings; the latter of the testimony of witnesses
personally appearing in court or before a proper efficer,
and, as a rule, sworn to the truth of what they depose.
In this sense the word is used to designate either the
task of going forward with the giving of evidence at the
trial or the task of satisfying the minds of the jury.
Owing to the different functions of the judge and the
cause when the plaintiff has given evidence which would
entitle him if unanswered to go to the jury, it is proper for
him to tell counsel that the burden of proof is on defendant, meaning that if the defendant adduces no evidence the plaintiff will be entitled to have the case submitted to the jury; but it is error for him thereupon,
whether defendant ofters evidence or not, to tell the jury
that the burden of proof is on defendant to contradic
plaintiff's case, for, considered as a task of satisfying the
jury, the burden of proof is never on the defendant in this sense, except in respect to an affirmative defense in avoidance as distinguished from a denial. (d)

One who speaks by a divine inspiration as the interpreter through whom a divinity declares himself. In the times of the Old Testament there was an order of propheta, for the duties of whose office men were trained in colleges called schools of the prophetz. The members of those schools acted as public raigious teachers, and the prophets in the stricter sense (inspired teachers) generally belonged to this order. In the New Testament, Christian prophets were recognized in the church as possessing a charism distinct from that of mere teachers, and as uttering special revolutions and predictions. They are often mentioned with apostles, and next after them in order.$

The word prophet (προφήτης) was derived in the first instance from the interpreters of the will of the gods see Findar, N., i. 91); later and especially it was applied to those who expounded the unintelligible oracies of the Pythoness of Delphi, or the rustling of the leaves of Dodous. In a metaphorical sense it was used of poets, as of interpreters of the gods or Muses. It was then adopted by the Septuagint as the best equivalent of the sabi or prophet of the Old Testament. . . In all these cases (Acts ii. 17, 18; xiii. 1; xv. 32; Rev. i. 8; xi. 3, ξ, 10, 18; xvi. 6; xviii. 20, 24; xiz. 10; xxii. 6, 7, 9, 10, 18), in the New Testament as in the Old, and it may be added in the Koran, the prominent idea is not that of prediction, but of delivering inspired messages of warning, exhortation, and instruction; indiding up, exhorting, and comforting; convincing, judging, and making manifest the secrets of the heart (1 Cor. xiv. 8, 24, 25). The andent classical and Hebrew sense prevails everywhere. Epimenides and Mahomet on the one hand, Rlijsh and Paul on the other, are called prophets, not because they forefold the future, but because they onlightened the present.

A. P. Stanley, Con. on Corinthians, 248.

2. One who foretells future events; a predicter; a foreteller; especially, a person inspired to announce future events.

The ancient Jews sometimes divided the Old Testament into the Law (Pentatuch) and the Prophets and sometimes (as still in theorem libits) into Law, Prophets, and Singlographs. In Hebrew libits the Former Prophets are Joshua, Judges, I. and H. Samuel, and I. and H. Kings; the Latter Prophets are the books from Isaiah to Malachi inclusive, with the exception of Lamontations and Daniel, which are placed in the Hagiographs. 3. prophets.

Syn. 1. Prophet, Seer, Soothsayer. A prophet is properly one who discloses or speaks forth to others the will of God; a seer is one who has himself learned God's will by a vision. Both titles were applied in the Old Testament to the same class of men, but at different times. The extra-Biblical uses of the words correspond to the Biblical. The word prophet is sometimes used in the Bible of a candidate for the prophetic office, or of an inapired preacher or interpretor. Soothsayer, as used in the Bible, implies imposture, and other literature its standing is little better.

=Byn. Atonement, Reconcilitation, Propitiation, Expisition, Satisfaction. By derivation and by Biblical usage atonement and reconcilitation are essentially the same; two that were alienated are made at one, or put back into friendship. Atonement, however, is not now applied to the relation of man to man, except in its extra-libilical extension, by which it means also the making of full and satisfactory amends (satisfaction) or the enduring of proper penalties (expisition) for a great wrong: as, there could be no atonement for such an outrage. As applied to the relations of God and man, atonement has been lifted into much greater dignity than any other word in the list; it is now the angust, chosen, and only endeared word for the effect of the lifte and especially of the death of Christ in establishing right relations between God and man; reconside and reconciliation are the principal words for this in the New Testament, atonement being used only once, and atone not at all. Propitiation is the only one of these words having exclusive reference to the feelings or purposes of the person or being offended; it is a severe word, implying alowness to relent, and is, in regard to the atitude of God toward man, chiefly a theological term. Expisition regards the guilt of the offense; it is the suffering of the penalty proper for an act (as, to make expision) although the fact is by the mass of Christians believed to lie in some form in the safferings of Christ. Satisfaction in this connection means adequate amends: as, satisfaction for one from in the safferings of Christ to be the word has been taken by a school in theology to express the sufficiency of the sufferings of Christ to meet the demands of the retributive justice of God.

Auspicious cannot be safely used in any meaning beyond that of giving omen or indication of success; an auspicious event is one that seems an omen of properly for that which follows. Auspicious could be applied to a person only by a highly figurative use of the word. The earlier tendency to use the word outside of the limits here indicated is not now sanctioned by good usage. Propitious applies primarily to persons, but may be freely extended by figure to things. Propitious goes beyond auspicious in representing a benign disposition and manner, leading one to expect a kind reception and help.

3. A representation in thought or language of an act of the mind in thinking a quality or an act of the mind in thinking a quality or general sign, termed a predicate, to be applicable to something indicated, and termed a subject. This connecting of predicate and subject may range from a mental necessity to a mere impulse to look at a certain possibility. These differences are called differences in the nande, or modality, of the propositions are either de inease (that is, the mode is not considered) or modal, and in this case problematical, contingent, or agreedictic. The modality may properly be said to affect the copula, or form of junction of the predicate and subject. The predicate, logically speaking, embraces the whole representation of the quality of the fact. Thus, in the proposition "Filjah was caught up to heaven," the grammatical predicate is "was caught up to heaven;"; but the logical predicate includes the whole picture which the sentence conveys that of a man caught up to heaven; there are not predicated includes the whole picture which the sentence conveys that of a man caught up to heaven; the sentence conveys that of a man caught up to heaven; the sentence conveys that of a man caught up to heaven; the sentence conveys that of a man caught up to heaven; the sentence conveys that of a man caught up to heaven; the sentence conveys that of a man caught up to heaven; the sentence are a relation, there may be several. These subjects. There are presented, however, is not a more picture; it views the fact represented always be served in the sentence, as by a finger-pointing. In ordinary language they are for the most part but imperfectly expressed. In whatever way they are represented, they can commonly (in the last analysis always) be set forth in classes only: from such a class the subject meant is to be taken in one or other of three ways: first, by a suitable selection, so as to render the proposition the world in the suit of thirdy, by taking no matter what one among a selected proportion of those which present themsolves in experience, and may proposition, as "Take any object you ple general sign, termed a predicate, to be applica-ble to something indicated, and termed a sub-

4. In polit. econ., the theory, doctrine, or system of fostering or developing the industries of a country by means of imposts on products of the industries imported into that country; the discouragement of foreign competition with the industries of a country by imposing import duties, granting monopolies of commerce, etc. The system of protection was little known in antiquity, but prevailed extensively in the middle

sgss, and has flourished widely since. A strong influence in favor of free trade was exerted in the eighteenth century by the physicerats and by the writings of Adam Smith. Great Britain adopted a system of practical free trade by the abolition of the corn-laws in 1846 and later years, followed by the removal of duties on nearly all imported articles. On the continent of Europe the general tendency in recent years has been in the direction of increased protection. In the United States the policy of protection has, especially in later history, formed one of the leading national questions. See saviench.—Plag of protection. See says.—Game protection. substance formerly supposed to contain protein Substance formerly supposed to contain protein
as an essential ingredient. The term is now applied
to a considerable number of nitrogenous hodies which
make up the substance of the soft tissues of the body and
of the blood, and are also widely distributed in the vegotable kingdom. They are amorphous solids, having certain general features in common, but differing widely in
solubility and in their decomposition products. The
gluten of flour, egg, albumin, the fibrin of the blood, syntonin, and casein are examples of proteids. Gelatin and
chondrin Huxley calls outlying members of the same
group. Also called albuminoid.

Food-stuffs have been divided into heat-producers and Food-stuffs have been divided into heat-producers and tissue-formers—the amyloids and fats constituting the former division, the proteids the latter. But this is a very misleading classification, inasmuch as it implies on the one hand that the oxidation of the proteids does not develop heat, and on the other that the amyloids and fats, as they oxidize, subserve only the production of heat. Proteids are tissue-formers, inasmuch as no tissue can be produced without them; but they are also heat-producers, not only directly, but because, as we have seen, . . . they are competent to give rise to amyloids by chemical metamorphosis within the body.

prothesis (proth'e-sis), n. [< L.I.. prothesis, < Gr. πρόθεσις, a putting before, proposition, purpose, preposition, < προτθέναι, put before, < πρό, before, + τιθέναι, put, place: see thesis. Cf. prosthesis.] 1. In the Gr. Ch.: (a) The preparation and preliminary oblation of the eucharistic elements before the liturgy: more fully called the office of prothesis. This office is said responsively by priest and descen. The priest signs an oblate with the holy lance, thrusts the lance into the right, left, upper, and lower sides of the holy lamb, lifts this off, cuts it crosswise, and stabs it. He then bleases the challes which the descen has prepared (mixed). Appropriate prayers and verses of Scripture accompany these rites. He then takes from the remainder of this and other oblates pyramidal pleese called portions of the Virgin Mary, apostics, martyrs, etc., the living and the dead, commemorating these classes, and arranging the portions in a prescribed manner our the disk (paten). Incense is then offered, the asterisk and vells placed over the elements are left in the chapel of prothesis till taken to the alter at the Great Entrance. (b) The table on which this preparation is made (the table or altar of prothesis). It answers to the Western credence. preparation is made (the table or altar of prothesis). Of or pertaining to the Protista.

Protium (pro'shi-um), s. [NL. (Wight and Arnott, 1884); perhaps from a native name in Java.] A genus of polypetalous trees of the order Burseraces and tribe Burseres. It is characterized by a free cup-shaped four- to six-eleft calvx, a cup-like disk bearing the four to six long narrow petals, and the eight to twelve unequal erect stamens on its margin, and a globose drupe, the fieshy outside splitting into four valves and the stone consisting of from one to four bony one-seeded nutlets, at first united together but finally free. There are about 50 species, natives of the tropics of both hemispheres. They are small trees, exuding a balsamic resin, and bearing pinnate leaves toward the end of the branchiets, composed of three or more large stalked leaflets. The small alender-pedicelled flowers form branching panicles borne on long stalks. P. Gudanesse is the hyaws or incense-tree of British Guians, and P. altiseissum is there known as white cedar. Some of the species have formerly been classed under Icics (Aubic, 1775). They produce many valuable gum-resins, for which see elemit, cooneid-resin, corneums, consums, and hyaves gum (under gum²).

Protecoccoides (pro to-ko ko de-e), n. pl. [NL., Protecoccus + -oides.] A class of minute plants belonging to the group Schizophyces, taking its name from the genus Protecocco cess, taking its name from the genus Protococcus. It includes those simplest forms of vegetable life in which the endochrome consists of pure chlorophyl of its natural green color, sometimes replaced, to a greater or less extent, by a red pigment, but never possessing in the cell-sap a soluble blue coloring matter. They are of microscopic size, and may occur in both the resting and the motile condition. They multiply very rapidly by pipartition and also by means of swarm-spores. This class is a purely provisional one, and probably includes many forms that are nothing more than stages in the development of size of greater complexity and belonging to widely separated families. The Protococcides embrace two orders, the Kremobies and Protococcuses. See Schizsphyces.

protomeristem (prō-tō-mer'is-tem), n. [ζ Gr. πρῶτος, first, + E. meristem.] In bot., primary meristem—that is, young and imperfectly developed meristem which forms the first foundation or beginning of an organ or a tissue. See meristem.

protomerite (prō-tom'e-rit), n. [$\langle Gr. \pi \rho \tilde{\omega} roc, first, + \mu \ell \rho oc, a part, + -i te^2$.] The smaller anterior one of the two cells of a dicystidan or septate gregarine. It may bear the epimerite, or probos-cis serving for the attachment of the parasite to its host, in which case the gregarine is called a *cephalont*. The protomerite is distinguished from the larger posterior deutomerite.

protomeritic (pro 'tō-me-rit'ik), a. [< pro-tomerite + -ic.] Pertaining to the protomerite of a gregarine.

Protomeryx (prō-tō-mē'riks), n. [NL., < Gr. πρῶτος, first, + μήρος, a ruminating mammal.] A genus of fossil camels of the family Camelidæ, mamed by Leidy in 1856 from remains of Miocene age of North America.

protomesal (prō-tō-mes'ul), a. [⟨ Gr. πρῶτος, first, + μέσος, middle: see mesal.] In outom., noting a series of wing-cells or areolets in hymenopterous insects, between the pterostigma or the costal cells and the apical margin. Kirinj. There may be as many as three of these cells, dis-tinguished as upper, middle, and lower. They correspond to the second, third, and fourth submarginal or cubital cells of modern entomologists.

Protomonas (pro-lom'ō-nas), n. [NL., ⟨ Gr. πρῶτος, first. + μόνος, single: see monad.] Λ genus of Monera, or myxopodous Protozoa, characterized by the production, after becoming encysted and rupturing, of free mastigopo-dous germs, which swim by means of a long vi-

dons germs, which swim by means of a long vibratile flagellum, like flagellate infusorians. In this free state the germs are mastigopods, but they afterward withdraw their flamentous pseudopodia, and become myxopods, which creep about by means of lobate pseudopodia. See out under Protomyza.

protomorphic (prō-tō-môr'fik), a. [⟨Gr. πρῶ-τος, first, + μορφή, form.] Being in the first, most primitive, or simplest form or shape; having a primitive character or structure; not metamorphie: as, "a protomorphic layer" [of tissue], H. Spencer, Prin. of Biol., § 290.

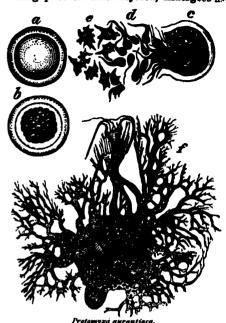

Protomyces (prō-tom'i-sēz), n. [NL., ⟨Gr. πρῶ-τος, first, + μίκης, a mushroom.] A small genus of zygomycetous fungi, type of the order

genus of zygomycetous fungi, type of the order genus of zygomycerous fungi, type of the order Protomycetaces. They are mostly parasitic upon the Umbeltifers, inhabiting the intercellular spaces of the leaf-stem, petiole, flower-stalk, and pericarp. They have a branching septate mycelium, upon which are formed at irregular intervals large oval resting progametangia. When the mycelium dies they persist and hibernate, and are liberated when the tissues of the host decay.

Protomyxa (prō-tō-mik'sā), n. [NL. (Haeckel, 1868). ⟨ Gr. πρῶτος, first, + μόξα, mueus.] A genus of Monera, represented by an organism which consists of a number of myxopods run

together into an active plasmodium, which, becoming quiescent and encysted, undergoes fix

exit to mastigopods resembling monads or fagella which after a while become anceloform myaopod which then units into a single active plasmodium (/ feeds, as upon the infusorians and the cliatoms of stance (these are a perfaintum above, next two ist orm myxopods (*), a number asmodhun (*), which grows the diatoms figured in its

sive multiplication within the cyst, and gives rise to a number of germs which alternate between the myxopod and the mastigopod state.

There is no means of knowing whether the cycle of forms represented by Protomonas and Protomyza is complete, or whether some term of the series is still wanting.

Huzley, Anat. Invert., p. 77.

protomyxoid (pro-to-mik'soid), a. [(Proto-myxa + -oid.] Resembling, relating to, or belonging to the genus Protomyxa.

The writer has attempted to explain the forms of free and united cells as specializations of a (protomyzoid) cycle in which variations of functional activity are accompanied by the assumption of corresponding forms, the whole series of changes depending upon the properties of protoplasm under the variations in the supply of energy from the environment.

protonephron (prō-tō-nef'ron), n.; pl. protonephra (-rā). [Nl., ⟨ Gr. πρῶτος, first, + νεφρός,
a kidney.] A primitive kidney or segmental
organ; the original renal organ of an embryo;
a Wolffian body, later absorbed or modified
into some other part of the urogenital system, and thus giving place to the permanent funcand thus giving place to the permanent func-tional kidney. In some of the lower vertebrates the renal organ is regarded as a persiatent Wolffan body, and therefore as a definitive protonephron. A protonephron is divisible into three recognizable structures, called pro-nephron, mesonephron, and metanephron. See these words. protonic (pro-ton'ik), a. [$\langle Gr. \pi \rho d, before, +$ τtoo , accent: see tonic.] Preceding the tone or accent.

Protonopside (prō-tō-nop'si-dē), n. pl. [NL. < Protonopsis + -idse.] A family of gradient or tailed amphibians, typified by the genus Protonopsis, without eyelids, with teeth on the anterior margin of the palatine bones, no dentigerous plates on the parasphenoid, vertebre amphiculian, no anterior axial cranial bone, the parietals and prefrontals prolonged, meeting and embracing the frontals, the wall of the vestibule membranous internally, premaxillaries separated, the occipital condyles sessile,

and well-developed limbs. Also called Mono-

Protonopsis (pro-to-nop'sis), n. [NL., irreg. (ir. Ilparen: (see Protean) + our, view.] A genus of tailed amphibians, typical of the famgenus or tanco ampinions, typical of the family Protonopsids: synonymous with Menopoma. See cut under heilhender.
protonotariat, protonotary (prō-ton-ō-tā'ri-ut, prō-ton'ō-tā-ri), n. See prothonotariat, pro-ton-tariat, pro-

disease; primary.

protopepsia (pro-to-pep giā), n. [NL., ζ Gr.

πρῶνος, first, + πέψε, digestion: see popsin.]

Primary digestion; digestion proper as it occurs in the cavity of the alimentary tract, and as distinguished from any further elaboration of the products effected in the walls of the intestine, the liver, or elsewhere.

protophlošm (prō-tō-flō'em), n. [⟨Gr. πρῶτος, first, + Ε. phloëm.] In bot., the first formed elements of phloëm in a vascular bundlo.

Protophyta (prō-tof'i-tā), n. pl. [NL., pl. of protophytum: see protophyte.] One of the primary groups or divisious of the vegetable kingdom, containing the lowest and simplest plants, and corresponding to the *Protozoa* of the aniand corresponding to the *Protozoa* of the animal kingdom. They are usually exceedingly minute plants, requiring the highest powers of the microscope for their study. The cells are in general poorly developed; the nucleus is wanting in many cases, and frequently there is either no cell-wall or an imperfectly developed one. They multiply most commonly by fission, the sexual or gans being unknown or only very slightly differentiated. According to the classification of Bennett and Murray, the *Protophyta* embrace two groups—the chlorophytlous group, or Schizophyteses, and the non-chlorophyllous group, or Schizophyteses, and the non-chlorophyllous group, or Schizophyteses, The first group includes the classes *Protopocoidess*, Datomaces, and Cyanophytese; the second includes the Bacteria. See Schizophyces and Schizomycetes.

protophytic (prō-tō-fit'ik), a. [< Protophytu +
-to.] Of or pertaining to the Protophyta, or having their characters.

protoplasm. (pro to plasm), n. [< NL. protoplasma, protoplasma, ML. protoplasma, the first creature or thing made (protoplasmus, the first man made), < MGr. πρωτό-πλασμα, < Gr. πρώτος, first, + πλάσμα, anything formed or molded: see plusm.] An albuminoid substance, ordinarily resembling the white of an egg, consisting of carbon, oxygen, nitrogen, and hydrogen in extremely complex and un-stable molecular combination, and capable, under proper conditions, of manifesting certain vital phenomena, as spontaneous motion, seusation, assimilation, and reproduction, thus constituting the physical basis of life of all plants and animals; sarcode. It is essential to the nature of protoplasm that this substance consist chemically of the four elements named (with or without a trace of some other elements); but the molecule is so highly compounded that these elements may be present in somewhat differother elements); but the molecule is so highly compounded that these elements may be present in somewhat different proportions in different cases, so that the chemical formula is not always the same. The name has also been consewhat loosely applied to albuminous substances widely different in some physical properties, as density or fulf-ty. Thus the hard material of so-called vegetable ivory and the soft body of an amosba are both protoplasmic. The physiological activities of protoplasm are manifested in its irritability, or ready response to external stimuli, as well as its imherent capacity of spontaneous movement

and other indications of life; so that the least particle of this substance may be observed to go through the whole cycle of vital functions. Protoplasm builds up every vegetable and animal fabric, yet is itself devoid of discernible histological structure. It is ordinarily colorious and transparent, or nearly so, and of glairy or viscid semifluid consistency, as is well seen in the bodies of foraminifers, amorbe, and other of the lowest forms of animal life. Such protoplasm (originally named asseeds), when not confined by an investing membrane, has the power of extension in any direction in the form of temporary processes (see pseudopodism) capable of being withdrawn again; and it has also the characteristic property of streaming in minute masses through closed membranes without the loss of the identity of such masses. An individuated mass of protoplasm, generally of microscopic size, and with or without a nucleus and a wall, constitutes a cell, which may be the whole body of an organism, or the structural unit of aggregation of a multicellular animal or plant. The ovum of any creature consists of protoplasm, and all the tissues of the most complex living organisms result from the multiplication, differentiation, and specialisation of such protoplasmic cell-unita. The life of the organism as a whole consists in the continuous waste and repair of the protoplasmic setli-unita. The life of the organism as a whole consists in the continuous waste and repair of the protoplasmic of the study from the chemical elements of that substance. The manufacture of protoplasm is a function of the vegetable kingdom. Plants make it directly from mineral compounds and from the atmospheru under the influence of tood-staff for the animal kingdom. Protoplasm appears to have been first recognizably described by Rösel, in or about 1755, in his account of the protepus-animalcule. It was observed, not named, seventeen years later by Corti, in the cells of Gram. Like motions of protoplasm were noticed by Meyen in 1827 in Vallimeria, and

Hence this substance, known in Vegetable Physiology as protoplans, but often referred to by sollogists as sarcode, has been appropriately designated by Prof. Huxley "the Physical Basis of Life." W. B. Carpenter, Micros., § 219.

For the whole living world, then, it results that the morphological unit—the primary and fundamental form of life—is merely an individual mass of proplasm, in which no further structure is discernible.

referred. Davess, Geol. Hist. of Plants, p. 24. prototype (prō'tō-tīp), s. [< F. prototype = Sp. It. prototype = Pg. prototype, a prototype; l.l. prototypus, original, primitive; < Gr. πρωτότυπος, in the first form, original, neut. πρωτότυπος, impression, model, type: see type.] A primitive form; an original or model after which anything is formed; the pattern of anything to be engraved, cast, etc.; an exemplar; an archetype; especially, in motrology, an original standard, to which others must conform, and which, though it may be imitated from and which, though it may be imitated from something else, is not required to conform to anything else, but itself serves as the ultimate definition of a unit. Thus, the metre des crehiese is a prototype, and so is the new international meter at Breteuil, although the latter is imitated from the former. But the meters distributed by the International Bureau are not prototypes, alone they have no authority except from the evidence that they conform to other measures.

In many respects (he) deserves to be enniched, as a pro-totype for all writers, of voluminous works at least. Sterne, Tristram Shandy, iii. 88.

The square or circular altar, or place of worship, may easily be considered as the prototype of the Sikra surrounded by cells of the Jains.

prototypembryo (pro to tip-em bri-o), s. [prototype + embryo.] A later stage of the embryo, which exhibits the essential characters bryo, which exhibits the essential characters of the division of animals to which it belongs. Thus, the veliger of a mollusk, the nanplius of a crusticean, and the notochordal stage of a vertebrate are respectively prototypembryos of the Mollusca, Crustacea, and Vertebrata. Hyatt. [Rare.]

prototypembryonic (prō'tō-tip-em-bri-on'ik), a. [\(\) prototypembryo(n-) + -ic.] Having the character of a prototypembryo. [Rare.]

prototypical (prō-tō-tip'i-kal), a. [\(\) prototype + -ic-al.]

Same as prototypel.

Their [the Maruta'] coming to the fight must be taken as prototypical of the coming of the Greek heroes to the great fields of battle. Keary, Prim. Belief, p. 152.

protovertebra (prō-tō-ver-tō-brā), n.; pl. protovertebra (-brā). [NL., < Gr. πρῶτος, first, + L. certebra, vertebra.]

1t. In Carus's nomenclature (1828), a rib regarded as a vertebral element developed to contain and protect the viscera, or organs of vegeta-tive life: correlated with destovertebra and tritovertebra. 2. A primitive, temporary vertebra; one of the series of segments which appear in pairs in the early embryo along the course of the notochord, and from or about which the permanent ver-

protovum (prō-tō'vum), n.; pl. protova (-vg). [NL., ζ Gr. πρῶτος, first, + L. ovum, egg: see ovum.] An original or primitive egg; an ovum or ovule in its first state, as when still in its Graafian follicle, or, in general, before its im-pregnation, when it becomes a cytula or parent-cell by fecundation with sperm; or, in the case of meroblastic eggs, an undifferentiated female egg-cell before it acquires the mass of non-formative food-yolk which converts it into a metovum.

protoxid, protoxide (pro-tok'sid), π. [(Gr. πρώτος, first, + E. oxid.] That member of a series of oxids which contains a single oxygen atom combined with a single bivalent atom or with two univalent atoms: applied only to oxids which are not strongly basic or acid.

protoxylem (prō-tō-zi'lem), n. [⟨Gr. πρῶτος, first, + Ε. xylem.] In bot., the first-formed elements of the xylem of a vascular bundle.

Protozoa (prō-tō-zō'ā), n. pl. [NL., pl. of Pro-tozoön.] Primordial or first-formed animals, tozoon.] Primordial or first-formed animals, or cell-animals; protozoans: a subkingdom of Animalia or prime division of animals, contrasted with Metazoa, or all other animals color cell-animals; protozoans: a subkingdom of Animalia or prime division of animals, contrasted with Metazoa, or all other animals collectively. The Protozoa are animal organisms consisting of a single cell, or of several cells not differentiated into tissues. This is the essential distinction between protozoan and metazoan animals, though no hard and fast line can be drawn around Protozoa to distinguish them on the one hand from Protozoa, and on the other from Metazoa. The name Protozoa was first used by Goldiuss (1809) to include microscopic animals and also the polyps and meduase. Siebold and Stannins first used it in its modern signification as comprising and limited to the infusorians and rhisopods. Owen (1869) used the term Protozoa for a kingdom including distoms, etc., and therefore synonymous with Protozoa. The sponges, in the view (as held by W. Saville Kent, for example) that they consist essentially of an aggregate of choanofisgellate infusorians, are often brought under Protozoa, though they have not only an ectoderm and an endoderm, but also a mesoderm, and are therefore tissue-animals as distinguished from cell-animals. Excluding sponges, Protozoa may be characterized as animals composed of a simple nearly structureless jelly-like substance called acrode, a kind of protoplasm, devoid of permanent distinction or separation of parts resulting from tissue-formation or histogenesis (though they may have very evident organs as parts of a single cell), without a permanent definitive body-cavity or any trace of a nervous system, no permanent differentiated alimentary system except in a most rudimentary state, and no multicellular membranes or tissues. Nevertheless, there is really a wide range of variation or gradation of structure in these seemingly structureless animalcules. Some of the lowest protozoans of which species and genera can be definitely predicated are the amosbiform organisms, which have a nucleus, and locomotory organs in the form any part of the body, and which ingest and eyest foreign s nnder various forms. The class Gregoriaids represents parasitic forms, one- or two-celled, essentially like the ova of Metasos. The class Injusorie comprehends an enormous number of minute, nearly always microscopic, animaloules, found in infusiona, inhabiting both fresh and asli water, sometimes parasitic, but mostly leading an independent fixed or free life. There are many groups of these, as the ciliate, fagellate, choanofagellate, and suctorial infusorians, among them the most complex organisms which are commonly included under Protosca, as the Nosiluce, for example. With or without the sponges, Protosca have been very variously subdivided, almost every anthor having his own arrangement. A so-called moner, an amobe, a foraminifer, a radiolarian, a gregarine, and an infusorian respectively exemplify as many leading types of Protosca. One division is into Astomate and Sonsabota, according to the absence or presence of a mouth. Another is into Moners and Endoplastica, according to whether the locomotory organs are temporary pseudopods or permanent cilia or fiagella. A third is into Gymnomyza and Corticata, according to the absence or presence of a distinguished as Mysopoda and Mesticopoda, according to whether the locomotory organs are temporary pseudopods or permanent cilia or fiagella. A third is into Gymnomyza and Corticata, according to the absence or presence of a distinguished set Mysopoda and Mesticopoda, according to whether the locomotory organs are temporary pseudopoda or permanent cilia or fiagella. A third is into Gymnomyza and Corticata, according to the absence or presence of a distinguishable ectoplasm. (1) The Gymnomyza and Corticata, according to the absence or presence of a distinguishable ectoplasm. (1) The Gymnomyza and Endoslaticata (the foraminifers), and Radiolaria. (2) The Corticates are divided into 6 classes: Sporozoa (gregarines and many others), Flagellata, Discolated, Thirdentes, and Polyatometa. (8ce these words.) Also called Hyposoa, Oticae, Plastidosa. Compare Primatia, Protita,

protozoal (pro-to-zo'al), a. [< protozoon + -al.] Same as protozoan.

protozodnal (prō-tō-zō'on-al), a. [< protozoōn + -al.] Pertaining to a protozoōn: as, protozoōnal collars and flagella. Hyatt.

protozoum, n. See protozoōn.

Protracheata (prō-trā-kō-ā'tā), n. pl. [NL., < L. pro, before, + Tracheata, q. v.] In Gegenbaur's system, one of three prime series into which all arthropods are divided (the others being Branchiata, or Crustacea in a wide sense, being Branchiata, or Crustacea in a wide sense, and Tracheata, or insects in the widest sense), established for the reception of the single genus Peripatus: thus conterminous with Malacopoda, Onychophora, and Peripatidea.

More exact investigations into the organisation of Peripatus show that this animal, which as yet has been generally placed with the Vermes, is the representative of a special class of Arthropoda which must be placed before the Trachesta (that is, Protrachesta).

1. In ornith, the glandular stomach; a second dilatation of the esophagus, succeeding the crop or craw, and succeeded by the gizzard, gigerium, or craw, and succeeded by the gizzard, gigerium, or muscular stomach. It is the true stomach of a bird, or place where digestion is chiefly carried on, and corresponds to the cardiac end or division of the stomach of a mammal. It is situated at the lower end of the gullet, next to the gizzard, and is always recognised by the gastric follicles which form a zone or belt of variously disposed patches upon its nuccous surface. Also called sentrecutus glandulorus.

2. In insects, the first stomach, the ingluvies or crop, being merely an expansion of the esophagus. It generally has thick muscular walls, and is often gramed interiorly with horny plates or teeth of various forms. The proventrioulus lies wholly or partly in the abdomen, and is generally absent in haustellate insects. See cut under *Hattida*.

4. pl. [cap.] One of the books of the Old Testament, following the Book of Psalms. The full title is Proverbe of Solomon (i. 1). It is a collection of the sayings of the sages of Israel, taking its full title from the chief among them, though it is by no means certain that he is the author of a majority of them. The original meaning of mashad, the Hebrew word translated 'proverh,' seems to be 'a comparison.' The term is sometimes translated 'parable' in our English Bible; but, as such comparisons were commonly made in the East by short and pithy sayings, the word came to be applied to these chiefly, though not exclusively. They formed one of the most characteristic features of Eastern literature.

small trees, sometimes shrubs, bearing alternate undivided leaves, usually finely toothed and folded lengthwise by the midrib (conduplicate) in the bud. The white, pluk, or rose-colored flowers are in umbel-like clusters or racemes, or sometimes solitary. Many of the most valuable fruit-trees belong to this genus, including the peach, apricot, cherry, and plum. Many are used as febrifuges or for other medicinal properties. A gum exudes from their bark, especially in the cherry. Nearly all parts contain the elements of prussic acid, rendering the kernels and bark of some species poisonous if esten freely, particularly the wilted leaves and young branches of some cherries. One fourth of the known species are American, of which 14 are found east and 6 west of the Booky Mountains. Mexico is the home of a remarkable group of 6 species (section Empecicadus, Torrey), extending to Utah and California, with velvety fruit, smooth stone, and solitary or twin flowers appearing with the leaves, somewhat akin to the almond. The section or former genus Amagadus has a downy fruit, rough and wrinkled stone, conduplicate vernation, and flowers preceding the leaves, and includes about 10 species, natives of warmer Europe and Asia, of which the type is P. Amagadus (A. communic), the almond, (See almond, almond-tree, Amagadus, and samgadus, and smydelius.) Its variety amara, the bitter almond, is the source of a well-known essence. P. Persica, the peach, is now placed in this section also. (See peach), nectarine, chaysame, and Persica.) The apricot section, Armeniaes (Tournefort, 1700), is similar in its downy drups and sowers preceding the leaves, but differs in its smooth stone and convolute vernation. It includes P. Armeniaes, the apricot; P. Sibirica, the Siberian apricot, valued for its earlier and ornamental flowers; P. despective, the black apricot, also Siberian; and P. Brigantiaes from Briançon in France, known as the mar

fiattened stone, and solitary or twin flowers preceding or accompanying the leaves, which are convolute in the bud, as in P. domestice, the cultivated plum, and its probable original, P. griscon, the sloe or blackthorm. (See plenal.) The related P. occomities of Calabria is valued in Italy as a remedy for fever. The plums of the New World differ in their conduplicate vernation, fruit with little or no bloom, and in some species very turgid stones, approaching those of the cherry, as in P. Americana, the red or yellow plum of the Atlantic States (also called Caneda plum and horsepium); P. maritims, the beach-plum; P. subcordata, the wild plum of California; and P. angustifolis (P. Chicasa), the Chickasaw plum, or hog-plum. The cherry section, Coveres, known by its smooth fruit without a bloom, conduplicate vernation, and solitary clustered or umbeled flowers preceding or accompanying the leaves, includes about 20 species, of which P. Coveres is the parent of the red and many other garden cherries. (See cherry!, Coveres, biggroom, and sworeld.—For P. avism, also called massard and merry, see gean and hegistery; also kired-wasser, marance, maranchery,). Two related species belong to the castern United States, the dwart P. pusudia, or sand-cherry, and P. Pennsylvanica, the wild red cherry, pincherry, and Estates, the dwart P. pusudia, or sand-cherry, and short-observy. (See pix-observy.) The section Padus contains cherries with racemed flowers following the leaves, and smaller, less edible fruit, as P. Pedus of Europe, known as berd-observy, and 4 American species, P. Caputi and P. demisea, the wild cherries, respectively, of Texas and the Rocky blountains; P. servitae, the black cherry, rum-cherry, or cabinet-cherry. Another section, Laurocareaus, suggests the true laurel in its evergreen leaves, and has racemed flowers with a short obconical calyx, a conduplicate vernation, and a small, smooth, in-edible berry-like fruit. It includes about 30 species, both temperate and tropical, mainly American, as P. occidentan

pseudogenus (sū-dō-jē'nus), n.; pl. pseudogen-era (-jen'e-rā). [NL., < Gr. ψευόψ, false, + L. genus, birth: see yenus.] 1. In bot., a formpseudogenus (sū-dō-jē'nus), n.; pl. necudogenera (-jen'e-rā). [NL., ⟨ Gr. ψενόη, false, + L. genus, birth: see genus.] 1. In bot., a formgenus; a genus based upon apparent species which are really only stages in the life-cycle of species of other genera. Many of the so-called genera of fungi, bacteria, etc., are pseudogenera. See form-genus, and compare form-genera. See form-genus, and compare form-species.—2. In soöi., a spurious genus. Pseudogenera, or pseudogeneric namea, may be due to (a) the imagination, as when hypothetical or supposititious ancestral forms, of which nothing is actually known, are named as genera (see several cases among words beginning in Pro. Proto.); (b) defect or error of observation, particularly of microscopic objects liable to look different when differently manipulated; (c) defective or mutilated specimens securately described but mistaken for normal examples of their kind; (d) natural monstrosities not recognised as such; (e) normal stages of growth or development of any organism mistaken for a different organism. Many pseudogenera of class (e) have been named among animals which undergo marked or peculiar transformations from the embryo to the adult, not understood by the observer at the time, as many colenterates, eachnoderms, crustaceans, etc., and even some vertebrates, as fahes and batrachians. Pseudogeners in the above senses are all foreign to the question of what degree of difference shall be accounted generic, and also of any question of priority or other nomenclature). The large class (e) class (e) have such standing as one may choose to allow them. Those of class (b) can have norstanding. In classes (e) and (e) pseudogenerio manes may hold if they can be identified and properly recharacterized (and are not obmolous to any rule of nonmonclature). Pseudomelania (sū-dō-mō-lā'ni-ā), n. [NL., ζ (fr. ψενόψ, false, + NL. Melania, q. v.] An extinct genus of shells superficially resembling a melanian, typical of the family Pseudomela-

Pseudomelaniidæ (sū-dō-mel-a-nī'i-dō), n. pl. [NL., < Pseudomelania + -idæ.] A family of tænioglossate gastropods, typified by the genus Paculomolania. They had clongated turreted shells with the aperture oral and the columella simple or plicated forward. The species inhabited the seas of the Palconaic to the Tertiary opechs, and are entirely extinct. pacudomembrane (su-dō-mem'bran), n. A false membrane. See membrane.

pseudomembranous (sû-dō-mem'brā-nus), a. Of, pertaining to, or of the nature of a pseudo-Of, pertaining to, or of the nature of a pseudomembrane.—Pseudomembraneous bronchitis, bronchitis with the formation of a false membrane lining the bronchial tubes. It may be due to diphtheria, to the inhalation of hot atoam, or to other causes.—Pseudomembranous entertits, a non-tebrile affection of the intential mucous membrane, characterized by the periodical formation of viscous, ahreddy, or tubular exudates composed mainly of mucin.—Pseudomembranes laryngitis, a laryngitis characterized by the formation on and in the mucous membrane of a croupous pseudomembrane; true croup.—Pseudomembrane trachettis, an infammation of the mucous membrane of the traches accompanied by the formation of a pseudomembrane.
pseudometallic (sū'dō-me-tal'ik), a. Falsely or imperfectly metallic: specifically applied to a kind of luster closely resembling that of metals.

pseudomonocotyledonous (sū-dō-mon-ō-kot-i-lō'dō-nus), a. In bot., having two or more cotyledons consolidated into a single mass, as in the horse-chestnut.

in the horse-chestnut.

pseudomorph (sū'dō-môrf), n. [< Gr. ψευδής,
false, + μορφή, form.] A deceptive, irregular,
or false form; specifically, in mineral., a mineral having a definite form belonging, not to
the substance of which it consists, but to some
other substance which has wholly or partially
diampered. other substance which has wholly or partially disappeared. Sometimes quarts is found in the form of fluor-spar crystals, the fluor-spar having been changed by a process of substitution into quarts. Such crystals are pseudomorphs by substitution; another illustration is that of tinstrue, cassiterite, after orthoclase feldspar. A more commun and important class of pseudomorphs includes those formed by the chemical alteration of the original mineral: these are illustrated by pseudomorphs of native copper after the oxid cuprite, where there has been a simple loss of one ingredient, in this case oxygen;

also, of gypsum after anhydrite, where the anhydrous encium sulphate has been changed by assumption of water to the hydrous sulphate; or, still more important, where there has been a more or less complete exchange of constituents, as of the lead carbonate carustic after the lead sulphid galeus, or of serpentine after chrysolite, or of kaolin after feldspar, etc. Pseudomorphs are also formed by molecular change without change of chemical substance, as of calcite after aragonite, or rutile after brookie; these last are also called paramorphs. (See paramorphism.) Pseudomorphs very commonly have a non-organism.) Pseudomorphs very commonly have a non-organism.

pseudomorphia (sū-dō-mōr'fi-s), n. [NL., < Gr. tevore, false, + NL. morphia.] One of the alkaloids of opium, C₁₇H₁₉NO₄. Also called

phormia, oxymorphia.

pseudomorphic (sū-dō-môr'fik), a. [< pseudomorph + -ic.] Same as pseudomorphous.

pseudomorphine (sū-dō-môr'fin), n. [< Gr.

ψευός, false, + NL. morphina, morphine.] Same

pseudomorphism (sū-dō-mōr'fism), n. [⟨ pseudomorph + 4sm.] The state of having a form, usually crystalline, different from that proper to the mineral; the process by which this state is brought about. See pseudomorph.

pseudomorphosis (sū'dō-mōr-fō'sis), n. [NL., ⟨ Gr. ψευδη, false, + μορφωσ, a shaping, ⟨ μορφῶν, form, shape, ⟨ μορφή, form.] Same as pseudomorphism.

pseudomorphosa (sū-dō-mōr'fus) σ.

pseudomorphous (sū-dō-mōr'fus), a. [< pseudomorph + -ous.] Not having the true form; characterized by or exhibiting pseudomorphism; in mineral., noting substances having an external form, usually crystalline, which does not properly belong to themselves. See pseudomorph.

pseudomorula (sū-dō-mor'ō-lā), n.; pl. pseudo-morulæ (-lō). A false morula: applied by W. S. Kent to a collection or aggregate of cells or spores of distinctly unicellular animals, resembling a morula, but of a different morphological charactor. See morula.

pseudomorular (sū-dō-mor'ō-lār), a. [< pseudomorula + -ar³.] Having the character of a

neudomorula + -are.] Having the character of a pseudomorula.

pseudonavicella (sū-dō-nav-i-sel'ġ), n.; pl. pseudonavicella (sū-dō-nav-i-sel'ġ), false, + LL. navicella, a small boat, dim. of navis, a ship: see nave².] The embryonic form of a gregarine; one of a number of minute bodies into which the substance of an adult encysted into which the substance of an adult encysted gregarine breaks up in reproduction. Pseudonavicells are so called from their resemblance to the navicells or navicula of distoms. On the rupture of the cyst of the adult gregarine these bodies escape; and on rupture of the pseudonavicells themselves the en-bryo proper is similarly set free. See pseudoflaria, and cut under Gregarindae. Also pseudonavicula.

pseudonavicella (sü-dö-nav-i-sel'är), a. [\langle pseudonavicella + $-ar^3$.] Pertaining to a pseudonavicella, or having its character, as the spores

Pseudoneuroptera (sū'dō-nū-rop'te-rä), n. pl. [NL., < Gr. ψευνής, false, + NL. Neuroptera, q. v.] An order of Insecta, proposed by Erichson in 1840 to contain those neuropterous insects which have the metamorphosis incomplete, four membranous wings usually manyveined, and mandibulate mouth-parts (except veined, and mandibulate mouth-parts (except in one family, Ephemeridæ). The order thus defined has been divided into three suborders: (1) Platypters, including the Perilds, Psocids, Embides, and Termitids; (2) Odonate or dragon-files; and (3) Ephemerida or May-files. Brauer, however, dismembers the Pseudoneuropters, and distributes its components in his second, third, fourth, and sixth orders—Ephemerida, Odonate, Psecopters, and Corrodentis—his Placopters including the perilds, and his Corrodentis the termites and Psecids.

Pseudoniscide (su-dô-nis'i-dê), n. pl. [NL., < Pseudoniscus + -idæ.] A family of synziphos-urous merostomatous crustaceans of Carboniferous age, typified by the genus Pacudonicus.
They had an oval body, short head, large compound eyes, and abdomen with seven segments besides the telson.

propensity to he.

pseudonucleolus (sū'dō-nū-klē'ō-lus), n.; pl.
pseudonucleolu (-ii). [NL., < Gr. ψενόη, false,

pseudopodium (sū-dō-pō'di-um), n.; pl. pseudopodia (-n.). [NL., < Gr. ψενόκ, false, + ποίς (ποδ-) = E. fvot.] 1. In Protozoa, as pseudopods, rhizopods, or myxopods, a temporary diversiform producentian or protrusion of the diversiform prolongation or protrusion of the sarcode or body-substance of the animalcule, to any extent or in any shape, capable of being withdrawn or reabsorbed into the general mass of the body, and serving as an organ of locomotion, prehension, or ingestion; a pseudopod, or false foot; generally in the plural. The term is very comprehensive in its application to foot-like, finger-like, or ray-like processes of the body of protozoans; but it is the essential character of a pseudopodium to be soft, diversiform, or variable in shape, and temporary, or subject to realsorption—in which respects the organ differs from the fixed or constant processes of many protozoans, as cilla or flagella. Pseudopodia are highly characteristic of the lower or non-corticate protozoans, the heliozoans, the foraminifers, etc. They may be broad and lobate processes of sarcade, or slender flamentous rays. When lobate the pseudopodia remain distinct from one another, their margins are clear and transparent and the granules which they may contain plainly flow into their interior from the more fluid central part of the body; or the whole body of the animalcule may flow into such a pseudopod, thus effecting a peculiar kind of locomotion. But when they are fillform they are very apt to run into one another, and give rise to networks, the constituent filaments of which, however, readily separate and regain their previous form; and, whether they do this or not, the surfaces of these pseudopodia are beset by minute granules, which are in incesant motion. Pseudosolaneæ (sū'dō-sō-lā'nō-ō), n. pl. [NL. (Bentham and Hooker, 1876), < Gr. ψευδής, false, + NL. Solaneæ.] A series or suborder of gamopetalous plants of the order Scrophularineæ, having some rolationship with the order Solanacæ, and characterized by alternate leaves, uniformly centripetal inflorescence, a five-lobed uniformly centripetal inflorescence, a five-lobed corolla with the two upper lobes exterior, and four, sometimes five, perfect stamens. It includes 0 genera and 3 tribes, of which the Verbasees, or the mullen tribe, is the chief. They are herbs or strubs, the flowers with a broad corolla-tube bearing rather flat and spreading lobes.

pseudospermic (sū-dō-sper'mik), a. [c pseudo-sperm-ium + ic.] In bot., forming or pertaining to a pseudospermium (sū-dō-sper'mi-um), n. [NL.

pseudospermium (sū-dō-spėr'mi-um), n. [NL., ⟨ Gr. ψενόγς, false, + σπέρμα, seed.] In bot., any one-seeded indehiscent fruit in which the pericarp so closely invests the seed that the whole appears as merely a seed—for example, an achenium.

pseudospermous (sū-dō-spēr'mus), a. [As pseudosperm-ic + -ous.] Same as pseudosper-

pseudosphere (sū'dō-sfēr), s. 1. A surface of constant negative curvature.—2. A sphere in non-Euclidean geometry.
pseudospherical (sū-dō-sfer'i-kal), a. Having

a constant negative curvature.

Were space really pseudospherical, then stars would exhibit a real parallax oven if they were infinitely distant.

Encyc. Bril., XV. 664.

Pseudospherical surface, a surface like that generated by the rotation on its axis of the curve

 $s + \sqrt{r^4 - y^4} = r \log \frac{r - \sqrt{r^4 - y^4}}{r^4 - y^4}$

Pseudospora (sū-dos'pō-rē), π. [NL., ζ Gr. ψευδής, falso, + σπόρος, seed.] A genus of myxomycetous fungi, typical of the family Pseudosporeæ, with plasmodium wanting, or at least unknown.

pseudospore (sū'dō-spōr), n. [< Gr. ψευδής, false, + σπόρος, seed.] In mycol., same as teleutospore.

Pseudospores (sū-dō-spō'rē-ē), n. pl. [NL. (Zopf), < Pseudospora + -es.] A family of myxomycetous fungi of the class Monadines,

typified by the genus Pseudospora.

pseudostella (sū-dō-stel'ā), π. [NL., ⟨ Gr. ψευψς, false, + L. stella, star.] A meteor or phenomenon of any kind resembling a star in the heavens.

pseudostigma (sū-dō-stig'mā), n.; pl. pseudo-stigmata (-ma-tā). A kind of false stigma with

which some tracheste scarines, as the Oributide or beetle-mites, are provided. In these miter the pseudostigmata are conspicuous, dorsal, tabular, and each has a filament projecting from the interior of the tube

pseudostoma (sū-dos'tō-mā), n.; pl. pseudostomata (sū-dō-stō'mā-tā). [NL.: see pseudostome.] 1. In anat., a supposed opening on the surface of a serous membrane, regarded as the mouth of one of the absorbents or lymphatic vessels which begin in such membranes. - 2 In soil.: (a) Same as psoudostome, 2. (bt) [cap.] The name-giving genus of Pseudostomida: synonymous with Geomys. Thomas Say, 1823. Also called Diplostoma, Saccophorus, and As.

pseudostomatous (sû-dō-stom's-tus), a. pseudostoma(t-) + -ous.] Provided with ps dostomata, as a serous surface; of or pertain-

ing to a pseudostoma.

pseudostome (sū'do-stom), n. [< NL. pseudostoma (cf. Gr. ψευόστομα, the false or blind mouth of a river), < Gr. ψευόστομα, false, + στόμα, mouth.]

1. The mouth or oral orifice of the pseudembryo or echinopeedium of an echinoderm; a pseudostoma: correlated with pseudoproct.—9. The false osculum or secondary opening replacing an original oscule of a sponge. Also called pseudoproct.

Secondary canals or cavities, which may be incurrent (restibular) or excurrent (closes), the opening of the latter to the exterior being termed a false oscule or pseudostoms.

W. J. Sollas, Enoyc. Brit., XXII. 416.

3. A pouched rat, or pocket-gopher, of North America, as Geomys bursarius. See Pseudontoma, 2 (b).

siphon + -al.] Of, pertaining to, or resembling resudent of cephalopods.

**Toma, 2 (v).

Pseudostomids (sū-dō-stom'i-dē), n. pl. [NL. the pseudosiphon of cephalopods. (Gervais, 1848), & Pseudostoma + -ids.] A (Gervais, 1848), \(Pseudostoma + -idsc. \) A family of American rodents, with external theek-pouches, named from the genus Pseudos-toma; the pocket-rats and pocket-mice, now dissociated in the two families Geomyidæ and

Saccomyidæ: the pseudostomes.

pseudostomine (sū-dō-stō'min), a. [< pseudostome + -ine¹.] Having external cheek-pouches, as a pocket-rat or pocket-mouse; saccomyine. pseudostomosis (sū'dō-stō-mō'sis), n. [NL., < pseudostome + -osis.] The formation or existence of a pseudostome, or false oscule, as that of a sponge. W. J. Sollas, Eneye. Brit., XXII.

pseudostomotic (sū'dō-stō-mot'ik), a. [< pseudostomosis (-ot-) + -ic.] Characterized by or exhibiting pseudostomosis; provided with pseudostomosis; dostomes or false oscules, as a sponge.

pseudostomous (sū-dos'tō-mus), a. [< pseudo-

stome + -ous.] Having pseudostomes, as a sponge; of or pertaining to pseudostomes. pseudostroma (sū-dō-strō'mā), n. In mycol., a false stroma; a cellular body resembling a stroma, as that produced in certain lichens.

See stroma.

pseudosymmetry (sū-dō-sim'e-tri), s. In orystal., false symmetry; the appearance of having a higher degree of symmetry than is actually the case, usually produced through twinning.

*Beudotetramera (sū'dō-te-tram'e-ri), n. pl. [NL. (Westwood, 1839): see pseudotetramerous.]
In Westwood's system of classification, one of the four prime divisions of Coleoptera, including those beetles in which the tarsi are five-jointed, but the fourth joint is minute and concealed between the lobes of the preceding. It is equivalent to the Crystopenicsmers of Burmelster and the Subpentagroups Rhynchophora, Longtorma, and Phytophays.

pseudotetramerous (sū'dō-te-tram'g-rus), «. [ζ Gr. ψευδής, false, + τέτταρες (τετρα-), four. + μέρος, part.] Having apparently four-jointed but actually five-jointed tarsi, as a beetle; of or

pertaining to the Pseudotetramera.

pendotinea (sū-dō-tin'ệ-Ḥ), n. [〈 Gr. ψενόψε.
false, + L. tinea, a worm.] The larva of certain pyralid moths, as the bee-moth, Galeria coreana, which feeds on wax, and is a terrible enemy to bees. They sometimes infold the cells in their webs to such an extent as to destroy the community. See Galeris, and out under bee-moth.

Pseudotrimera (sū-dō-trim'e-rā), n. pl. [NL. (Westwood, 1839): see pseudotrimerous.] In Westwood's system of classification, one of the four prime divisions of Coleoptera, including those beetles in which the tarsi are four-jointed, the third joint being very diminutive and concealed between the lobes of the preceding. It is equivalent to the Oryptotetramers of Burneister and to the Substramers and Trimers of Latrelle. It includes the three families Brotylides, Endomychides, and Cocchalides.

tarsal joints, as a Decile; or or pertaining to the Pseudotrimera.

Pseudotrimera (sū-dot-sū'gš), n. [NL. (Carrière, 1867), < Gr. ψενόης, false, + NL. Tsuga, q. v.] A genus of coniferous trees of the tribe Abietiness. By Eichler, Bugler, and others it is united with the related genus Tsuga, the hemlock-spruce, from which it has been distinguished by the absence of resin-vesicles in the seeds, by the smooth branchiets, and by cones fringed with conspicuous sharply two-lobed bracts much longer than the scales, with their midribs prolonged into a spine or bristle. There is but one species, P. Douglassi, discovered by the Scotch botanist Lavid Douglas, in Oregon, in 1832, the most widely distributed timber-tree of the Pacific States, known as red or yellow fr. Oregon pine, Douglas fr. Douglas spruce, and Douglas pine. (See Oregon pine, under pinel.) The wood is unlike that of any related conifer in its abundance of spirally marked wood-cells. The trees are at first pyramidal and spruce-like, afterward more spreading, with very thick and rough brown bark. They bear flat and very narrow linear leaves, spirally inserted, but spreading somewhat in two ranks by a twist at the base, and handsome pendulous cones, which are nearly cylindrical, 2 or 3 inches long, and are matured the first year. In the variety succreasing, and the larger seeds contain as many as from nine to twelve seed-leaves.

Pseudoturbinolides (sū-dō-ter-bi-nol'i-dē), n. at [NI. (Gr. sientifer false, + NI., Turbino-tol.]

Pseudoturbinolidæ (sū-dō-ter-bi-nol'i-dō), n.
pl. [NL., < Gr. ψευόης, false, + NL. Turbinoidæ.] A family of extinct aporose solerodermatous corals, resembling Turbinolidæ, but with
septa each composed of three laminæ free internally, externally united by a single costa. pshaw (shâ or pshâ), v. i. [\(\text{pshaw}, interj. \)] To The genus Dasmia is an example. Also called utter the interpolation. Edwards and Haims, 1850. pshaw;

pseudova, n. Plural of pseudovum.

pseudoval (sū-dō'val), a. [pseudovum + -al.]
Of or pertaining to a pseudovum or metovum.

Huzley, Anat. Invert., p. 331.

pseudovarian (sū-dō-vā'ri-an), a. [< pseudovary + -ian.] Of or pertaining to a pseudovary: as, a pseudovarian tubule; a pseudovarian tubule; a pseudovarian tubule; a pseudovarian tubule;

The terminal or anterior chamber of each pseudorarian tube is lined by an epithelium, which incloses a number of nucleated cells.

Itually, Anat. Invert., p. 885.

pseudovarium (sū-dō-vā'ri-um), n. [NL.: see pseudovary.] Same as pseudovary.

A portion of the cells . . . becomes converted into a pseudovarium, and the development of new pseudova commences before the young leaves the body of its parent. It is obvious that this operation is comparable to a kind of budding.

Husley, Anat. Invert., p. 447.

pseudovary (sū-dō'vā-ri), n.; pl. pseudovaries (-riz). [<NL. pseudovarium, < Gr. ψευής, false, + NL. orarium, ovary: see ovary1.] 1. The ovary of a viviparous insect, as an aphis, in which are developed the kind of ova called pseudova.

The young are developed within organs which resemble the ovarioles of the true females in their disposition, and may be termed pseudocuries.

Husley, Anat. Invert., p. 385.

2. The filmy pellicle or so-called proligerous membrane of infusions of hay, etc., out of which infusorial animalcules were supposed to be produced by the heterogenists, or believers in spon-

taneous generation.

psendovelar (sū-dō-vē'lār), a. [< pseudovelum + -ar³.] Vascular, as the velum of a scyphomedusan; having the character or quality of a

pseudovelum. pseudovelum (sū-dō-vē'lum), n.; pl. pseudovela (-lʰ,). [NL., < Gr. ψενόής, false, + NL. volum.] The vascular velum of some hydrozoans, as the The vascular velum of some hydrozoans, as the Scyphomedusæ, containing enteric vessels, and regarded as morphologically distinct from the true velum of the Hydromedusæ. See velum.

Pseudoviperæ† (sū-dō-vǐ'pe-rō), n. pl. [NL. (Oppel, 1811), < Gr. ψευδή, false, + L. vipera, viper.] The wart-snakes (genera Acrochordus and Erpeton).

pseudoviperine (sū-dō-vi'pe-rin), a. [As Pseudoviper-æ + -inel.] Having the appearance of a viper or other venomous serpent, but harmless, as a wart-snake; pertaining to the Pseudose. doviperæ.

pseudo-volcanic (sū'dō-yol-kan'ik), a. pseudo-volcanic (su do-vol-kan ik), a. Fet-taining to oa produced by a pseudo-volcano. pseudo-volcano (sū'dō-vol-kā'nō), s. A vol-cano that when in a state of activity, emits smoke and sometimes flame, but no lava; also, a burning mine of coal.

Pseudovomer (sû-dō-vô'mèr), n. [NL., < Gr. ψευδής, false, + L. vomer, plowshare: see vomer.] A genus of fossil carangoid fishes of Miocene

pseudotrimerous (sū-dō-trim'g-rus), a. [⟨Gr. pseudovum (sū-dō'vum), s.; pl. pseudova (-vā). Psilides (sil'i-dō), s. pl. [NL. (Loew), ⟨ Psila pseudova (-vā). Psilides (sil'i-dō), s. pl. [NL. by the active embryos.

One of the hindermost of these cells enlarges and becomes detached from the rest as a pseudowss. It then divides and gives rise to a cellular mass, distinguishable into a peripheral layer of clear cells and a central more granular substance, which becomes surrounded by a structureless cutiouls. It is this cellular mass which gradually becomes fashioned into the body of a larval sphis.

Busiley, Anat. Invert., p. 286.

The ova which originate in it [pseudovary] and are incapable of fertilization [it will be convenient to call] the pseudova.

Psidium (sid'i-um), n. [NL. (Linnœus, 1737),
said to have been so called in allusion to the succulent fruit; irreg. Gr. \(\psi \text{icev}\), \(\psi \text{iev}\), \(\psi \text{eev}\), feed on pap, \(\psi \text{dim.} \text{-ibov}\). A genus of polypetalous trees and shrubs of the order \(\mathbf{Myttaces}\) and tribe and shrubs of the order myruces and tribe
Myrtes. It is characterized by a broad calyx-tube bearing four or five lobes which are closed in the bud and become separated on flowering, four or five spreading petals, an ovary commonly with four or five cells, and numerous many-ranked ovules containing a curved and ringlike embryo. There are over 100 species, all American,
except one in Asia, and all tropical or subtropical. They
are commonly hairy or woolly, and bear opposite featherveined leaves, rather large cymose flowers, and roundish
or pear-shaped berries, sometimes crowned with the calyxlobes, often edible, and known as guava. See guava (with
out).

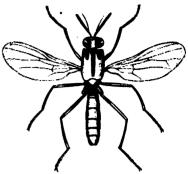

Pails (si'ls), n. [NL. (Meigen, 1803), < Gr. ψι-λός, bare, naked, smooth, blank, mere.] A notable genus of dipterous insects, typical of the family Psilidæ, containing shining-black or rust-colored flies, the larvæ of which feed on the roots of plants. P. rosæ of Europe is a root of the current and schloe. pest of the carrot and cabbage. See cut under Pollide.

rilanthropic (si-lan-throp'ik), a. [< psilanthrop-y + -ic.] Of, pertaining to, or embodying psilanthropism. Coloridge. (Imp. Dict.) psilanthropism. Coloruge. (Imp. Incl.)
psilanthropism (si-lan'thrō-pism), n. [< psilanthrop-y + -ism.] The doctrine or belief of
the mere human existence of Christ. [Rare.]
psilanthropist (si-lan'thrō-pist), n. [< psilanthrop-y + -ist.] One who believes that Christ was a more man; a humanitarian.

The schoolmen would perhaps have called you Uniciste: but your proper name is Pallanthropiats—believers in the mere human nature of Christ.

Coloridge, Table-Talk, April 4, 1832.

psilanthropy (si-lan'thro-pi), n. [< LGr. ψιλάν-θρωπος, merely human, ζ ψιλός, bare, mere, + ἀνθρωπος, man.] Same as psilanthropism.

comprising a few small forms distributed in a half-dozen genera, of which Psila and Loxocera are the most notable.

region, and the branchial apertures in advance of the eyes. The only species is from East Indian seas.

Pailocephalus (nī-lō-sef'a-lus), n. [NL. (Swainson, 1839), Gr. ψελός, hare, + κεφαλή, head.] 1. The typical genus of Psilocephaline, contain-

Psilocethalus barbatus.

ing the fish otherwise known as Anacanthus barbatus.—2. In entom.: (a) A genus of dip-terous insects. Zetterstedt, 1842. (b) A genus of coleopterous insects of the family Psetu-

phidæ. Raffray, 1877.
Palloceras (si-los'e-ras), n. [NL. (Hyatt, 1868), ζ Gr. ψιλός, bare, + κέρας, horn.] A genus of Jurassic ammonites of the family Arietidæ, to which, according to Hyatt, all the forms of true ammonites may be traced. P. planorbis is an example.

psiloceratite (si-lō-ser'n-tit), n. [< Psiloceras (-corat-) + -twl.] A fossil cephalopod of the genus Psiloceras.

silodermata (sī-lō-der'mṣ-tḤ), n. pl. Same as Amphibia, 2 (c).

pallodermatous (si-lō-der'ma-tus), a. [⟨ Gr. ψιλός, bare, + δίρμα, skin.] Having the skin naked (that is, not scaly), as an amphibian; of or pertaining to the Psilodermata.

psilology (si-lol'ō-ji), n. [ζ Gr. ψιλός, bare, mere, + -λαγία, ζ/έγειν, spoak: see -ology.] Love of idle talk. Coloridge. [Rare.] Imp. Dict. psilomelan (si-lom'e-lan), n. Same as psilomelane. Encyc. Brit., XV. 479.

psilomelane (si-lom'e-län), n. [ζ Gr. ψιλός, bare, + μέλας (μελαν-), black.] A hydrous oxid of manganese occurring in smooth botryoidal and stalactitic forms and massive, and having a color iron-black to steel-gray.

psilomelanic (si'lō-me-lan'ik), a. [< psilome-lane + -ic.] Pertaining to or consisting of psilomelane.

The writer found in one of these [manganese nodules]
. a total of 21.04 per cent. of the pailomelanic part.
Encyc. Brit., XV. 479.

Pailonotides (si-lō-not'i-dō), n. pl. [NL., < Psilonotus + -idee.] In Gill's system of classification, a family of gymnodont plectognath fishes, represented by the genus Psilonotus. They are among the smallest plectognaths, and inhabit tropical seas. The frontals are separated from the supraoccipital by the intervention of the postfrontals, which are connected together and laterally expanded but short; the ethnoid is prominent above, enlarged and narrow forward; the vertebre are few about 8 + 9; the head is compressed, with a projecting attenuate snout, and the dorsal and anal fins are short and psuciradiate.

Psilonotus (si-lō-nō'tus), n. [NL., < Gr. ψιλός, bare, + νῶτος, back.] The typical genus of Psilonotidæ.

Psilonotidæ.

Pailopades (sī-lō-pē'dēz), n. pl. [\langle Gr. $\psi \lambda \delta c$, bare, naked, $+ \pi a i c$ ($\pi a i \delta$ -), pl. $\pi a i \delta c c$, child.] In ornith., in Sundevall's system (1872), a primary group of birds, embracing those which are hatched naked and require to be fed in the nest by the parent. The term is nearly conterminous

with Altrices, but of more exact signification. The antithesis is Ptilopædes or Dasypædes. Also called Gymmo-

psilopsedic (si-lo-pē'dik), a. [< Psilopsed-es + -tc.] Of or pertaining to the Psilopsedes: opposed to psilopsedic and hesthogenous. Also gymnopædio.

Pailophyton (si-lof'i-ton), n. [NL., < Gr. ψιλός, carps and lycopods, and so named by him in consequence of its partial resemblance to certain usitic lycopods placed in the modern genus Parletien. This plant is abundant in the Devonian of Gaspé Bay, Canada. Remains of plants referred to this genus by Lesquereux are also said to have been found in both Ohio and Michigan: in the former case, in rocks of Lower Silurian age; in the latter, of Upper Silurian. The plant has also been found in the Devonian of England and Germany.

Psiloptera (si-lop'te-rii), n. [NL. (Solier, 1833), \langle Gr. $\psi\lambda\delta\epsilon$, bare, naked, $+\pi\pi\epsilon\rho\delta\nu$, wing, = E. feather.] An important genus of buprestid beetles, comprising more than a hundred species, extremely variable in form, and found mainly in Africa and South America.

Pailorhinus (si-lō-ri'nus), n. [NL. (Rüppell, 1831), ζ Gr. ψιλός, bare, + μίς (μιν-), nose.] An American genus of Corvidæ, containing large magpie-like jays, of dark coloration, with very long graduated tail, crestless head, a stout bill, and naked nostrils; the smoky pies. There are several species, as the brown jay, P. morio. This bird inhabits Texas and Mexico, is smoky-brown, paler below, with bluish gloss on the wings and tail, the bill black or yellow, the length 16 inches, of which the tail is about one half.

Pailosomata (sī-iō-sō'ma-tā), n. pl. [NL., ζ Gr. ψιλός, bare, + σῶμα, body: see Psia.] In De Blainville's classification (1825), a family of his Aporobranckiata, consisting of the genus The Approximation of the state of the state of the Phyllishhoë alone. It was one of three families of pteropods, contrasting with Theosemants and Cymnosimata. It is now generally called Phyllishoids and referred to the nudibranchiates. See cut under Phyllishoids and referred to the nudibranchiates.

psilosopher (si-los'ō-fer), n. [⟨Gr. ψιλός, bare, mere, + σοφός, wise.] A would-be or pretended philosopher; a sham sage; an incompetent or mean pretender to philosophy. [Rare.] Imp.

Psittaci (sit'a-si), n. pl. [NL., pl. of Psitta-cus.] An order of birds, having the bill hooked cus. An order of birds, having the bill hooked and cered, and the feet yoke-tood; the parrots, or the parrot tribe. This is one of the most natural and well-marked groups in ornithology, formerly referred to an "order" Scansors. The feet are permanently agodactyl by reversion of the fourth toe, and covered with rugose or granular scales or plates. The wings have ten primarles, and the tail has ten rectrices. Thie bill is strongly epignathous, and furnished with a naked or feathered cere. The tongue is thick and fleshy, sometimes peculiarly brushy, and may be used as an organ of taction or prohension; the upper mandible is peculiarly movable, and the beak is habitually employed in progression. The symphysis of the lower jaw is short and obtuse. The bony orbits of the eyes are often completed by union of the iscrymal with the postorbital process. The sternum is entire or simply fonestrated behind, and the clavioles are weak, sometimes defective or wanting. The lower larynx or syrinx is peculiarly constructed, with three pairs of intrinsic muscles. The plumage is after-shafted; the oil-gland is absent, or present and tufted; there are no occess and no gall-bladder; the carotid arterios are variable; the ambiens muscle is present, variable, or absent; the fomorocaudal, semit endinosus, and its accessory are present; the accessory femorocaudal is absent. The Patitaci are considered to represent only one family, Patitacides; or two families, Patavardides and Patitacides (Garrod, Cones); or three families, Patavardes, Cacatudies, There are upward of 400 species, inhabiting all tropical regions, but poorly represented in the temporate sones. They are chiefly frugivorous, and are sometimes called frugivorus Raptores. II. a. Same as psittacine.

Psittacidæ (si-tas'i-dō), n. pl. [NL., < Psittacus + -idæ.] A family of Psittaci; the parrots. (a) The only family, conterminous with the order. In this sense the Psittacidæ are divided by Finach into 5 subfamilies: Stringopinæ, owl-parrots; Psicolophinæ, cockatoos; Stitacinæ, with numerous genera, both American and Old World; Psittacinæ; and Trichoploæinæ, the lories. See outs under out-parrot, parrot, parrotse, et cockatoos, and divided into Pezoporinæ, Arinæ, Lorinæ, Trichoploæinæ, Nestricinæ, and Psittacinæ. G. R. Gray. (c) Restricted by exclusion of the Palæornithinæ to Psittaci with two carotids, of which the left is normal, and divided into Arinæ, Pyrrhurinæ, Platyceroinæ, and Chrysotinæ. Gerrod; Couse. (d) Restricted to the gray African parrots of the genera Psittacus and Coracopsie. Reichenous. II. a. Same as psittacine.

paittacine (sit'a-sin), a. [< I.L. psittacinus, of or pertaining to a parrot, < psittacus, a parrot: see Psittacus.] Parrot-like; resembling or related to parrots; of or pertaining to the Psittaci or Psittacide in any sense; psittacomorphic. Also psittacean, psittaceas, psittacid. Psittacini (sit-a-si'ni), n. pl. [NL., < Psittacus + -ini.] Same as Psittaci.
psittacinite (sit'a-si-nit), n. [< psittacine + -ite².] A vanadate of lead and copper from Montana, occurring in thin crusts of a siskin or

The science of the phenomens of mind; mental science. It is said to have originated with Pythagorus. Aristotle greatly improved it, and stated its most important principle, that of the association of ideas. It has, however, only recently taken the position of a universally acknowledged science; and its mothods are still in dispute. Some psychologists hold that we know the mind by direct intuition in consciousness; others, distinguishing between consciousness and self-consciousness, hold that the former involves no recognition of the mind, while the latter is not an original power, but only acquired knowledge. But, though such inward vision be denied, most psychologists still consider the observation of what passes within us as the main foundation for psychology. Others regard introspection as too deceptive to be of much use, and some deny its possibility. A few psychologists only, since Descartes, have held that the distinctions we naturally draw about mental functions—as, for example, between thinking and willing—have, in good part at least, a real significance. The great majority have denied this, explaining that the feasibless are nothing in the soul (which fiself has no parts), but are mere conveniences of description. Nevertheless, these writors are accused by many modern psychologists of practically assuming that our natural ideas of mind, just as physicists assume that among the conceptions which appear simple and natural to man are likely to be found those that are embodied in laws of nature. The prevalent school of modern psychologists attributes great importance to systematic experimentation by one person upon another, especially to quantitative determinations, as of the time occupied in different mental projects. The prevalent school of modern psychologists attributes great importance to systematic experimentation of given intensity, and the like; yet some of the older generation predict that the utility of this method will be found to have n

The vital organism is evolved from the bioplasm, and we can now see how the psychical organism is evolved from what may be analogically called the psychoplasm.

... We may represent the molecular movements of the bioplasm by the neural tremors of the psychoplasm, these tremors are what I call neural units—the raw material of Consciousness. The movements of the hoplasm constitute vitality: the movements of the hoplasm constitute vitality: the movement of the psychoplasm constitute sensibility. We may say that the sentient material out of which all the forms of consciousness are evolved is the psychoplasm, incessantly fluctuating, incessantly renewed.

It is characterized by corymbose or panicled of the order Rubiacess, type of the tribe Paychotries. It is characterised by corymbose or panicled flowers with a five-lobed valvate corolla, a short calyx-tube having a small five-toothed horder, linear or oblong-obtuse anthers fixed by their back near the base, entire and membranaceous stipules, and a drupaceous fruit with two plano-convex nutlets. It is a vast and polymorphous genus, one of the largest among plants, containing about 455 species, all tropical and especially American. They are shrubs or small trees, rarely perennial herbs, either erect, climbing, or twining. They bear opposite entire and sometimes whorled leaves, and stipules within the peticles, often twin and united into a sheath. The small flowers are white, green, red, or yellow. Most of the species have handsome leaves, but are inconspicuous in flower. P. parasities, a rad-berried, fleshy-leafed species of the

West Indice, is there known as climbing-wine. P. daph-noides, a small evergreen, is the brushland sege-tree of Australia. P. emetics yields the drug strinted ipconcu-anha (see specsousanha), and some other species furnish a

dysaun.

Psychotries (si-kō-tri'ō-ā), s. pl. [NL. (Bentham and Hooker, 1873), 'Psychotria + -ee.]

A large tribe of plants of the order Rubiaces, the madder family. It is characterised by an ovary with two or many cells, each with a single basilar erect anatropous ovule and inferior radicle; a valvate corolla bearing the stamens on its threat; a stigma entire or nearly so; and an indehiscent truit, commonly with two nutlets, corneous albumen, and curved embryo. It includes about 1,084 species of 22 genera, mostly tropical trees or shrubs. Psychotric (the type) with 425 species, Psikosures with 135, Rudges with 92, and Uragoga (Gephasia) with 120, are large genera mainly of America, and Lasianthus with 80 species is principally Asiatic.

Pteropode (te-rop'ō-dĒ), n. pl. [NL., neut. pl. of pteropus (-pod-), wing-footed: see pteropod.]

1. A division of Mollusca, having the mesopodium or middle part of the podium or foot ex-panded into a pair of large alate lobes like wings or flippers, and used as such to swim with; the preropods. The ctenidia are abortive, the nephridium is single, and the general configuration is more or less unsymmetrical, somewhat as in gastropods. The propodium may be produced into tentaculiform organs. There are otidia or ottopsis, and one osphradium. The preropods are hermaphroditic or monoscious; there are organs of copulation and a single genital pors. According to the presence or absence of a mantic-skirt and shell, the Pteropoda are Theocomata and Gymnosomata. All are oceanic. They originally formed the second class of Cuvier's branch Mollucca, under the Krench name Pteropodes. By most combologists this view has been socepted, but others have unitted the pteropods with the cephalopods, and still others with the gastropods. By several anatomists they have been approximated to the teetthranchiates, and even supposed to be derived from different stocks of that order—the theocomes from the Cophalospides, and the gymnosomes from the Anappiden. Also called Copmanta. See cuts under Cacolinidae and Theumodermon.

pterosaur (ter'ō-sar), **m. [< Pterosaur-ta.] A member of the Pterosauria; a pterodactyl.

Pterosauria (ter-ō-sa'ri-ā), **n. pl. [NL., < Gr. πτερόν, wing, + σαῦρος, a lizard.] 1. An order of extinct Mesozoic Reptilia adapted for flight; the pterosaurians, pterodactyls, ornithosaurians, or flying-dragons. The whole fore limb is modified to support a flying-membrane somewhat like that of bats, and the rest of the skeleton is conformable with this modification. The vertebre are comparatively few, procedous, those of the neck very large, and from three to six of the pelvic ones are united to form a sacrum. The anterior ribs have bifurcated heads. The skull is of great size, with long heavy jaws and large eye-sockets including a circlet of sclerotic ossifications. The sternum is broad and carinate, the scapula and coracoid are alender, and clavicles are wanting. The phalanges of the ulnar digit are extremely long and strong, and support the parachute. The hind limbs are smaller than the fore limbs, and comparatively weak. The order contains the families Pterosauridæ and Pteranodontidæ. They lived from the Lias to the Chalk. See out under pterodactyl. Also called Ornsthosauria, Pterodactyli.

2. Same as Pterosauridæ.

pterosaurian (ter-ō-sâ'ri-an), a. and n. I. a. Of or pertaining to the Pterosauria; ornitho-

pterosaurian (ter-o-sa'ri-sn), a. and s. I. a. Of or pertaining to the Pterosauria; ornithosaurian.

II. n. A pteresaur, pteredactyl, or ernithe-Baur.

Pterosauridæ (ter-ō-sâ'ri-dē), n. pl. [NL., < l'terosauria + -idæ.] A family of pterodactyls, of the order Pterosauria, with teeth and separate scapula and coracoid bones. It is represented by such genera as Pterodactylus, Rhamphorhynchus, and Dimorphodon, from the Jurassic formation. Also Pterosauria.

Pterospermum (ter-ō-spēr'mum), π. [NL. (Schreber, 1789), ζ Gr. πτερόν, wing, + σπέρμα, seed.] A genus of polypetalous trees and shrubs of the order Sterouliaces and tribe shrubs of the order Storouliaces and tribe Holiotores. It is characterised by stalked anthers, with parallel linear cells, woody round or five-angled five-valved capsules, and winged seeds. The 16 species are all natives of tropical Asia. They are commonly clothed with stellate halrs, and bear oblique coriseous leaves, and elongated flowers, which are axillary and nearly or quite solitary, and consist of a tubular five-cleft calyx with five obverte petals and a prominent column of united stamens. The flowers are usually white, fragrant, and several inches in length. P. acertoistem and P. suberifoliess are trees of the East Indics, sometimes cultivated under the name of viruguesed. P. Javansieum is the bayur of Java.

Pharoappora (ta-ros 'nō-rō) m. Fill. (Nuttall.

Pterospora (te-ros pō-rē), π. [NL. (Nuttall, 1818), ζ Gr. πτερόν, wing, + σπόρος, seed.] A genus of root-parasitic plants belonging to the ornus of root-parasitic plants belonging to the order Monotropes. It is characterised by a gamopetalous urn-shaped corolla with five short recurving lobes, five persistent sepals, ten stamens with pendulous anthers facing inward and two-spurred on the back, and a five-lobed and five-celled capsule filled with minute seeds which terminate in a large and broad hyaline reticulated wing. The only species, P. andromedes, known as pinedrops, is a alender, purplish-brown, clammy-hairy, and scaly herb, growing 1 or 2 feet high, leafless like most parasites, and with roots consisting of a mass of coral-like thickened fibers. The white nodding flowers are borne in a long raceme. It is a rare plant, found on hard clay soil under pines from Vermont and Pennsylvania northward and westward across the continent. From its early discovery near Albany, and its resemblance to beechdrops, it is also known as Albany beechdrops.

Dierostigma (ter-ö-stig'mä), n.; pl. pterostig-

drops, it is also known as Albany beech-drops.

pterostigma. (ter-ō-stig'mā), n.; pl. pterostigmata (-ma-tā). [NL., < Gr. πτερόν, feather,
wing, + στίγμα, a spot, mark: see stigma.] The
carpus or stigma, a peculiar mark or spot on the
wings of some insects. It is a dark-colored triangular or quadrate space on the anterior border of the fore
wings of lymenopters, and on both fore and hind wings
of dragon files. It corresponds to that one of the costal
cells which is thickened to strengthen the costal border.

— Funestrate pterostigma. See fenestrate.

pterostigmal (ter-ō-stig'mal), a. [< pterostigmas + -al.] Pertaining to a pterostigma or having its character; pterostigmatic: as, a ptero-

ing its character; pterostigmatic: as, a ptero-

ing its character; prerosugmation, stigmal cell or spot, pterostigmatic (ter-o-stigmat'ik), a. [< pterostigma(t-) + -ic.] Having a pterostigma, as an insect's wing; provided with pterostigmata, as an insect; pterostigmal.

pterestigmatical (ter'o-stig-mat'i-kal), a. pterestigmatic + -al.] Same as pterestigmatical Hagen.

Hagen.

pterotheca (ter-φ-the ki), n.; pl. pterotheca (-sē). [NL., < Gr. πτερόν, mig-case, or that part of the integument of a pupa on which is outlined the undeveloped wing beneath it.

pterotic (te-rot'ik), a. and n. [< Gr. πτερόν, feather, wing, + ούς (ωτ-), = Ε. ear, + -tc.] I. a. In soil. and anat., noting an ossification of the periotic capsule or petrosal bone, distinct from the protite, epiotic, and opisthotic, which occurs in some vertebrates between the protitic and the epiotic.

curs in some vertebrates between the profite and the epiotic.

II. m. À pterotic ossification. See first cut under teleost and cut under Esox.

Pterotraches (ter φ-tra-ke s), m. [NL. (Fors-ke), Gr. πτερόν, wing, + τραχύς, fem. τραχία, rough: see traches.] The typical genus of Pterotraches Also called Firola.

Pterotracheacea (ter-ō-trā-kē-ā'sē-ā), n. pl. [NL., < Pterotrachea + -acca.] The Pterotrache-ids considered as a suborder of heteropods.

Pterotracheidse (ter'ō-trā-kō'i-dō), n. pl. [NL. (J. E. Gray, 1840), < Pterotrachea + -ids.] A family of shell-less heteropods, typified by the genus Pterotra-

Different limita haw signed to it. By some it is extended to all the heteropods with the branching complete to the component of the complete the component of the complete the complet

chies carried in a dorsal pedunole and protected by a small or no shell, and the mesopodium lamelliform.

By others it is limited to Pterotraches and Pteroloides, having the visceral hump, reduced to a mere oval sac, embedded in the posterior region of the body, no shell, and a sylindrical sing-like form. Also called Ptrolides and, as a suborder, Pterotrachesces.

Pterceamites (ter-ō-zam'1-tēs), π. [NL. (Schimper, 1870), < Gr. πτερόν, feather, + Zam-(Schimper, 1870), (Gr. πτερον, ιεαιπετ, τ zumites, q.v.] A genus of fossil eyeadaceous plants, differing from other genera chiefly in having only the stronger veins fork at base. It embraces about 5 or 6 species, found in the Rhetic, Lias, and Oblite of Europe.

Pterura (te-rö'rä), n. Same as Pteronura.

pterygial (te-rö'rä), n. [< pterygium + -al.]

Of or pertaining to a pterygium.

pterygium (te-rij'i-um), n.; pl. pterygia (-ä).

[NL., also pterygion; cf. L. pterygium, < Gr. πτερύνου, a little wing, a fin, projection, film over the eye, growth of flesh over the nails, dim. of πτερώ (πτεριν), wing (πτεριν) wing father see πτέρυξ (πτερυγ-), wing, ζπτερόν, wing, feather: see ptere.] 1. In soöi. and anat., a limb or member

of one of the vertebrates, as a fish, in the most general sense, without reference to its specialization ence to its specialization in any given instance. A hypothetical ptergium, whence other ptergis are supposed to have been evolved, is an arakigation is an inhibitary in modification is an inhibitary in modification is a chiropterpoism. Parts of the ptergium of an elasmobranchiate fish have been called mesopterpoism, metapterpoism, propergium, metapterpoism, metapterpoism, metapterpoism, propergium, metapterpoism, propergium, metapterpoism, propergium, metapterpoism, propergium, metapterpoism, propergium, propergium, propergium, metapterpoism, metapterpoism, propergium, metapterpoism, metapterpoism, propergium, propergium, metapterpoism, propergium, proper

and subconjunctival tissue with its apex at the edge of the cornes or upon the cornes.—8. In entom., one of the two lateral expansions at the end of the rostrum of certain weevils. They lie above and partly conceal the scrobes or grooves in which the antenne are concealed.

Pierygium, or (right) Pec-toral Limb of the Monkish (Squarting). 2, propterygium; ms., teacopterygium; ms., metapterygium—bear-ing respectively the propte-rygial, metopterygial, and metapterygial basaila and radialia.

pterygoblast (ter'i-gö-blåst), n. [⟨Gr. πτέρυξ (πτερυγ-), wing, + βλαστός, germ.] A germinal fin-ray; the histological element from which the embryonic fin-rays of fishes are developed.

J. A. Ryder.

ptergobranchiate (ter'i-gō-brang'ki-āt), a. [⟨Gr. πτέρνξ (πτερνγ-), feather, + βράγχια, gills.]

Having feathery gills: noting a section of isopods, in distinction from phytobranchiate.

pterygoda (ter-i-gō'dā), s. pl. [NL., ⟨Gr. πτέρνγωσης, wing-like: see pterygoid.] In entom.,

the tegules, a pair of small movable scales or epaulets attached to the mesothorax of Lepidoptera, near the insertion of the first legs.

In front of the fore wings . . . are a pair of perygoda, kind of epsulettes, which extend backwards. Letrelle, in Cuvier's Règne Animal (trans.), ed. 1849, ID. 476.

pterygode (ter'i-gōd), n. One of the pterygoda.

Also pterygoid. J. O. Westwood.

pterygofaceting (ter'i-gō-fas'et-ing), n. [<
pterygo(id) + facet1 + -ing1.] The formation
of an articulate facet for the pterygoid bone on
the rostrum of a bird's skull. Couse.

plerygo(id) + facet¹ + -ing¹.] The formation of an articulate facet for the pterygoid bone on the rostrum of a bird's skull. Couses.

pterygoid (ter'i-goid), a. and s. [⟨ Gr. πτερυγουδης (contr. πτερυγωδης), wing-like, feathery, ⟨ πτέρυξ (πτερυγ-), a wing, + είδος, form.] I. a. Wing-like or wing-shaped; aliform or alate: specifically applied in anatomy to certain bones or bony processes and associate parts.

— Pterygoid arbery, a branch of the internal maxillary, from the second or pterygoid section of that vessel, supplying the pterygoid muscles.— Pterygoid bones, the pterygoid.— Pterygoid conal. Same as Védésa cossal (which see, under conal).— Pterygoid fossa. See fossal.— Pterygoid.— Pterygoid muscles, the pterygoid processes of the sphenoid. In man the external pterygoid processes of the sphenoid. In man the external pterygoid ridge, and extends nearly horisontally outward to be inserted into the condyloid section of the lower jaw-bone: it is also called ectopiorygoid. The internal pterygoid muscle arises from the pterygoid process of the lower jaw-bone: it is also called entopterygoid and suternal masseter. The pterygoid muscles effect the lateral and forward and backward movements of the jaw, and the internal maxillary raises it.— Pterygoid nerves, two branches of the internal raisillary raises it.— Pterygoid nerves, two branches of the internal maxillary raises it.— Pterygoid nerves, two branches of the internal maxillary raises it.— Pterygoid process. (c) Either one of two parts of the compound sphenoid bone of mammals. (1) The external pterygoid process is a process or extension of the alisphenoid, or great wing of the sphenoid bone, having no independent center of ossification, and never being a distinct part. (2) The fracternal pterygoid process, or the other hand, is a distinct bone, the pterygoid process, on the other hand, is a distinct bone, the pterygoid process, on the other hand, is a distinct bone of lower vertebrates. These processes are also distinguished as ectopterygoid and external pter

II. s. In sool and anat.: (a) A bone of the facial part of the skull, forming a part of the hard palate, or pterygopalatal bar, commonly a horizontal rod-like bone, one of a pair on each side of the median line intervening between the palatal and the quadrate bone, or suspensorium of the mandible, and movably articulated with both, frequently also articu-lating with the basisphenoidal rostrum of the skull: in any mammal, detached from its pos-terior connection with the suspensorium, and commonly immovably sutured with the palatal and ankylosed with the sphenoid, when it forms the part known in human anatomy as the interthe part known in human anatomy as the internal pterygoid process of the sphenoid. In fishes there are several different pterygoid bones, entering into the formation of the pterygopaistal bar or palatoquadrate arch, and distinguished as entopterygoid, estopterygoid, and metapterygoid: see these words, and out under palatoquadrate. See also cuts under demograthous, dromasognathous, periodic, Pstomyson, Physics, poison-frang, Python, and temporomasioid. (b) A pterygoid muscle.—2. pl. In entom., same as pterygoid.

pterygoideus (ter-i-goi'dē-us), n.; pl. pterygoidei (i). [NL:: see pterygoid.] A pterygoid muscle.—Pterweoideus externus or minor and

muscle.—Pterygoideus externus or minor and pterygoideus internus or major, two stout muscles of mastication; the pterygoid muscles (which see, under pterygoid.).—Pterygoideus proprius, a small occasional muscle of man, passing from the alisphenoid to the outer plate or tuberosity of the palate.

pterygomaxillary (ter'i-gō-mak'si-lā-ri), a. [< pterygo(id) + maxillary.] Pertaining to a pterygold process or the pterygold bone and to entire the superior or inferior maxillary bone: spe-cifically applied in anatomy to several parts. ss or the pterygoid bone and to either chuckly applied in anatomy to several parts.

—Pterygomaxillary fiscure. See famos.—Pterygomaxillary fold, the fold formed by the pterygomaxillary ligament in the mouth, back of the last moin tooth.

—Pterygomaxillary ligament, a tendinous band passing from the apex of the internal pterygoid plate to the posterior extremity of the internal oblique line of the lower jaw.

pterygopalatal (ter'i-gō-pal'ā-tal), a. [< ptery-gopalatal (ter'i-gō-pal'ā-tal), a. [< ptery-gopalatal bar, the movable series of bones which connect the upper jaw of vertebrates below mammals with the suspensorium of the lower jaw. No such bar occurs in mammals, in which the lower jaw has no suspensorium, and the pterygoids are entirely cut off from con-

nicctions behind. In birds the bar is always a single and almple pterygold bone, movably articulated behind with a quadrate and in front with a palate-bone. The case becomes complicated in lower vertebrates by the presence borore than one pterygold, and in fishes with several pterygolds, variously disposed, the arrangement is more commonly called the palatoquadrate crok. See cut under palatoquadrate.

pterygopalatine (ter'i-gō-pal'ā-tin), a. [< pterygopalatine (ter'i-gō-pal'ā-tin), a. [< pterygoid) + palatine².] Pertaining to the pterygoid process of the sphenoid, or to the pterygoid bone, and to the palate or palatebone: as, the pterygopalatine branch of the internal maxillary artery.—Pterygopalatine artery, a small branch of the internal maxillary, which passes through the pterygopalatine canal to the pharyux, nasal fossa, and sphenoidal sinus. Also called pharyageal artery.—Pterygopalatine foramen. See forumen.—Pterygopalatine foramen. See forumen.—Pterygopalatine narve, a small branch of Mcckel's ganglion that passes through the canal of the same name to the pharyux.

pterygo-pharyngeus (ter'i-gō-far-in-jō'us), n.

intering the stand of the same name to the partyns.

[NL., pterygo(sd) + pharyngeus. That part of the superior constrictor of the pharynx which arises from the internal pterygoid pro-

which arises from the internal pterygoid pro-cess.—Pterygo-pharyngous externus, a snall super-numerary muscle arising from the lamular process and inserted into the wall of the pharyns. pterygoquadrate (ter'i-gō-kwod'rāt), a. [< pterygo(id) + quadrate.] 1. Pertaining to the pterygoid bone proper and to the quadrate bone, or suspensorium of the lower jaw, as in a ver-tebrate below mammals: as, the pterygoquad-rate articulation.—2. Combining elements of the pterygoid and quadrate because of the

the pterygoid and quadrate bones: as, the pterygoid and quadrate bones: as, the pterygoguadrate cartilage of a shark.

pterygoguphenoid (ter'i-gō-sfō'noid), a. [< pterygo(id) + sphenoid.] Same as sphenopterygoid.

pterygospinosus (ter'i-gō-spī-nō'sus), n.; pl. pterygospinosi (-sī). [Nl.: see pterygospinous.]

arising from the sphenoidal spine and inserted into the external pterygoid plate.

pterygospinous (ter'i-gō-spi'nus), a. [< NL. pterygospinous, < E. pterygo(id) + L. spinosus, spinous.] Pertaining to a pterygoid process and to the spine of the sphenoid...Pterygospinous ligament, a fibrous band running from the spine of the sphenoid to the posterior margin of the outer pterygoid plate.

pterygostaphylinus (ter"i-gö-staf-i-li'nus), n.; pl. pterygostaphylini (-nī). [NL., Gr. πτέρυξ (πτερυγ-), wing, + σταφυλή, uvula.] Same as tensor palati.

pterygostium (ter-i-gos'ti-um), n.; pl. pterygosta (-4). [Also pterygosteum; NL. (Leach, 1820), ⟨Gr. πτερύξ (πτερυγ-), wing, + 1. ostium, mouth.]
One of the nervures or veins of an insect's wing. They are thickenings of the two surfaces of the upper and lower wing membranes exactly opposed to each other, the inner surfaces being grooved so as to allow the circulation of fluids and the entrance of traches.

prerygostomial (ter'i-gō-stō'mi-al), a. [⟨Gr. πτερύς (πτερυγ-), wing, + στόμα, mouth, + -ial.]
In soöl., noting the flaring anterior edges of the carapace of crustaceans, when these turn forward in front of the bases of the limbs, parallel with each other and with the axis of the to with each other and with the axis of the body. Milno-Edwards.—Pergressomial plates, those parts of the carapace of the brachynous crustaceans which run forward parallel with the axis of the body. Husley, Anat. Invert., p. 296.
ptergostomian (ter'i-gō-stō'mi-an), a. [< ptopgostomian (ter'i-gō-stō'mi-an), a. ptorygostomial. [Rare.]

Epistome longer than wide, and the pterypostomian regions rudimentary. Eng. Cyc., Nat. Hist., III. 575.

Pterygota (ter-i-gō'tä), n. pl. [NL., neut. pl. of Pterygotus: see pterygote.] One of the prime divisions of Insecta, containing all hexapodous insects except Aptera. Gegenbaur. They are normally winged (wingless only as an adaptive specialized modification), and metabolous—that is, they undergo a more or less complete metamorphosis. Also called Pterodicera, Pterophora, and Ptilota.

pterygote (ter'i-gôt), a. [⟨NI. Pterygotus, ⟨Gr. πτερυγωτώ, winged, ⟨πτέρυξ (πτερυγ), wing: see pterygium.] Winged; alate; having wings or wing-like parts; specifically, belonging to the Pterygota.

pterygotrabecular (ter'i-gō-trā-bek'ā-lār), a. [/pterygo(id) + trabecular.] Pertaining to the pterygoid bone and the trabecular region of the skull.

A well developed pterugo-trabecular process -- homolo-ous . . . with the pedicle of the tadpole's suspensorium. A. S. Woodward, Proc. Zool. Soc., 1886, p. 221.

Pterygotus (ter-i-gō'tus), n. [NL., ⟨Gr. πτερυ-γωτός, winged: see pterygote.] A genus of ex-tinct crustaceans of the Silurian period, belong-ing to the group Eurypterida, occurring chief-

ly in the passage-beds between the Silurian and iy in the passage-beds between the Shurian and the Devonian system. It has a long lobster-like form, composed in the main of a cephalothorax, an abdominal division of several segments, and a somewhat oval telson or tail-plate. The organs of locomotion, three or four pairs in number, are all attached to the under side of the carapace, as in the king-orab. P. anglious is a species sometimes called seraphirm.

Terrigura (ter-i-gū'ri), π. pl. [NL., < Gr. πτερίς (πτεριγ-), feather, wing, + ω'ρά, tail.]
A division of anomurous decapod crustaceans.

A division of anomurous decapod crustaceans, pterygurous (ter-i-gū'rus), a. Of or pertaining to the l'tergura.

pteryla (ter'i-l\u00e4), n.; pl. pterylæ (-l\u00f6). [NL., < Gr. $\pi\tau\epsilon\rho\delta r$, feather, wing, + $i\lambda\eta$, wood.] A feather-tract; one of the sets or clumps of feathers which are inserted in definite tracts or areas in the wine of a bird separated by a reference. thers which are inserted in definite tracts or areas in the skin of a bird, separated by apteria, or places where no feathers grow. The fact that bird's feathers are seldom implanted uniformly over the whole skin, but usually grow in definite patches, had been known long before the publication of Nitssch's "System of Pterylography" in 1840; but it remained for this author to define the principal pteryles and point out the taxonomic significance of pterylosis. The most constant pteryles are eight: (1) Pteryle spinalis, the spinal or dorsal tract, from the nape of the neck to the tail, subject to much modification. (2) Pteryle humeralis, the humeral tract, on each wing, running from the shoulder obliquely backward, parallel with the scapula. (3) Pteryle femeralis, the temperalis, the ventral tract, forming most of the plumage of the under parts, and presenting numerous modifications. (5) Pteryle capitalis, the head-tract. (6) Pteryle alaris, the wing tract. (7) Pteryle caudalis, the lattictact. (8) Pteryle orwalis, the lower leg-tract.

Ptilopus (Strickland, 1841).
Ptilopus (Strickland, 1841). [ζ Gr. πτίλον, down, + παίς (παιδ-), child.] In ornith., in Sundevall's classification, a primary group of birds, embracing such as are clothed at birth with down (which sprouts not only from ptery-

with down (which sprouts not only from pterylæ, but also from parts of the skin which form apteria when the true plumage is acquired), and are generally able to run about and feed themselves when hatched: opposed to Psilopædes: nearly equivalent to Præcoces, but of more exact signification. Also called Dasypædes, Autophagi.

 ptilopædic (til-ō-pē'dik), a. [< Ptilopæd-es + -tc.] Of or pertaining to the Ptilopædes; pruecocial: opposed to psilopædic.
 Ptilophyton (til-lof'i-ton), a. [NL. (Dawson, 1878), (Gr. πτίλον, feather, + ψυτόν, a plant.]
 A plant of very uncertain affinities, so called by Dawson and supposed by him to be aquatic, and more likely to have been allied to rhizocarps than to any other group. It consists the parties. than to any other group. It consists of beautiful feathery fronds, bearing on parts of the main stem or petiole small rounded sporocarps. It is found in the De-vonian and Lower Carboniferous of New York, in Nova Scotia, and in Scotland.

Ptilopteri (ti-lop'te-ri), n. pl. [NL., < Gr. πτί-λον, feather, + πτερόν, wing.] The penguins as an order of birds: conterminous with Im-pennes, Squamipennes, Sphenisci, and Sphenisco-

mornhæ.

Ptilorhis (til'o-ris), n. [NL. (Swainson, 1825), erroneously Ptilornis and Ptiloris, prop. *Ptilorrhis, ζ Gr. πτίλου, soft feather, + ρἰς (ρω-), nose.] A genus of Paradiscides, belonging to the subfamily Epimachines, or slender-billed birds of paradise, having the tail not longer than the body, and a jugular shield of metallic plumas. plumes. The nostrils are feathered, whence the name. Four species of these beautiful birds inhabit Australia and New Guinea—P. paradisea, the rifle-bird, P. victorias, P. alberti, and P. (Craspedephora) magnifica. See cut under rifle-bird.

ptilosis (ti-lō'sis), n. [NL., ⟨Gr. πτίλωσις, plumage, also a disease of the eyelids resulting in loss of the eyelashes, ⟨πτιλοϊσθαι, be winged (or feathered), $\langle \pi r i \lambda \sigma v$, feather, wing.] 1. In ornith., plumage; the feathering of a bird, considered with reference to the texture or other character of the feathers themselves. Compare pierylosis.—2. In mod., loss of the eyelashes.

Ptilota (ti-lo'tā), n. pl. [NL. (Macleay, 1821), ζ Gr. πτιλωτός, winged, verbal adj. of πτιλούσ-θα, be winged: see ptilosis.] In Macleay'a classification, one of the prime divisions of the

class Insecta, distinguished from Aptera, corresponding to Latreille's Pterodicera, and divided primarily into Mandibulata and Haustellata. Bee Pterypota.

Ptilotis (ti-lō'tis), n. [NL. (Swainson, 1837), (ir. milum, feather, + oig (ir.) = E. car.] A very extensive genus of meliphagine birds. It includes nearly 40 species, ranging through the Austromalayan, Australian, and Polynesian regions, mostly of plain dull olivaceous and yellowish colors, with the akin of the sides of the head often bare and wattled, or the parotic feathers (car-coverts) stiffened and usually white or yellow, forming a consplicuous mark, whence the name. P. chrysoile and P. corunculata are examples.

Ptinias (tin'i-dê), n. pl. [NL. (Leach, 1819), (1918) + -idx.] A large family of serricorn coloopterous insects, containing beetles of

coleoptorous insects, containing beetles of small size, having the antenna with from nine to eleven joints, the head retractile, and the elyto eleven joints, the head retractile, and the elytra entire. Both larve and beetles feed mostly on deaminal and vegetable matter. The larve eat drug, even pepper and tobacco. Some 44 genera and 150 species are recognised in the United States. Lasicalevaes servicorus is known in the United States as the ciparetts-bestle, on account of the damage it does to cigarettes. Sticdreps panices is a wide-spread museum-pest, and is found in many drugs. Members of the genus Anobism are known as death-reatches. Many of the species are cosmopolitan. See out under book-worm.

See Bonne's engageration, under projection.—Ptolemaic protection, under projection.—Ptolemaic grysem, the structure of the heavens according to Ptolemy, an Egyptian-Greek astronomer, whose recorded observations extend from 137 to 161 A. D. His "Treatise of Mathematics" (Magnesus' vierseix) commonly called the "Almagest," is mainly devoted to an investigation of the movements of the heavenly bodies. Ptolemy holds that the earth is stationary, because there is no appearance of variation in the perspective of the fixed stars. He admits it would simplify astronomy to suppose it rotated daily on its axis, but thinks that refuted by physical considerations, while, regarding the stars as devoid of weight, he sees no objection to supposing them to move with immense velocity. But these two errors of denying the motion of the earth both in translation and in rotation were not incompatible with a correct representation of the motions of the planets relatively to the earth. The figure shows his theory of Mars, which was exactly like that of Jupiter and Saturn. He supposed that about a circular deferent, which was really nearly similar and similarly placed to the true orbit of the planet shout the sun, moved andrian geographer and astronomer Ptolemy

Phychopteris (ti-kop'te-ris), n. [NL., < Gr. πτύξ (πτυχ-), πτυχή, a fold, + πτερίς, fern.] In fossil bot., a genus of fossil ferns, known chiefly from the form of the leaf-scars. These are elongated-oval or elliptic in form; of their details but little has been made out. The fern-stems which have been placed in this genus are said by Schimper to been a close resemblance in external appearance to the living Cymthes and Aleophila. They are found in abundance in the Carboniterous, especially in the St. Etienne (France) coalfield, where they occur associated with leaves of Peopleric, to which they may belong.

fold, + σπέρμα, seed.] A genus of palms of the tribe Areces, type of the subtribe Ptychospermes. It is characterised by monoscious flowers, both series within the same spadix, the staminate flowers having orbicular concave broadly imbricated and heeled sepals, acute petals as many as the sepals, and from twenty to thirty stamens—the pistiliate flowers being smaller, nearly globoes, and having a single overy which becomes a one-celled fruit whose thick florous pericarp contains a single erect seed with ruminate albumen and a smooth or deeply five-grooved surface. The 11 species are natives of the Malay archipelage, Papua, Australia, and the islands of the Pacific. They are thornless palms, with a tail trunk marked by annular sears, and terminal pinnately divided leaves with the segments commonly dilated to the broad spex and there erose, or appearing as if eaten off. The flowers are small, and are borne in clusters on the slender spreading branches of a spadix inclosed by two spathes. The species are of little known industrial use, but rank among the most elegant of decorative palms. Those in greenhouse outitivation are sometimes called in general feether-palms, and very often Seaforthia (R. Brown, 1810), from Lord Seaforth, a patron of botany. P. Seemens, a beautiful dwarf species, produces a stem only about one inch in diameter and very strong and straight. Most of the species reach a commanding height: among them P. Alexandra, the Alexandra palm, is remarkable as the tallest palm of Australia, exceeding 100 feet in height; P. Cunndughansi, the Illawarra palm, as found further south than almost any other palm; and P. (Seaforthic) elegans, the bangalow palm, as the most common in cultivation, and one of the most beautiful of all palms. The trunk of the last-named species is a smooth cylindrical shaft, swollen at the base and crowned by drooping feather-like leaves of a bright and intense green. Each leaf-stalk is dilated at the base into a amooth bright-green sheath completely inclosing the upper part of the t

In the male it is narrower and more scute-angled than in the female, being in the former case like a letter V inverted. It represents a great part of the interior outlet of the pelvis. Also called arch of the pubis, concitmes subpuble arch...—Pubic creat, the crists pubis (which see, under crists).—Puble cligaments, certain ligaments uniting the two puble bones: an anterior, a superior, an inferior, and a posterior are distinguished, respectively specifically called propuble, suprapuble, suprapuble, suprapuble, and postpuble.—Puble ramus, one of the two branches of which each pubis chiefly consists in man and some other animals. In man the two rami are (s) the anjerior or horisontal, forming much of the true brim of the pelvis, and ankylosed with the filum, and (s) the inferior, oblique, or descending ramus, forming each half of the pubic arch, partly circumscribing the obturator foramen, and ankylosed with the fact units.—Puble spine, a prominent tubercle on the upper border of the horisontal ramus of the pubis of man, about an inch from the symphysis. Poupart's ligament is inserted into it. Also called subcreation public or tuberculeus publicum.—Public symphysis, or symphysis publis, the coming or growing together of the right and left public bones at the median line of the pubs. It may be a simple apposition or articulation of the bones, or complete ankylosis. In man the bones are commonly articulated but not ankylosed, forming in any case an immovable joint.—Public evin, a tributary to the external line vein from the obtarator vein.

[NL., for os pubis: os, bone; pubis, gen. of pubes, pubes: see pubes.] In anat. and zoöl., a pubic bone, or bone of the pubes (os pubis); a distal inferior and anterior division of the pelvic arch, forming a part of the os innominatum or forming a part of the os innominatum or haunch-bone by ankylosis at the acetabulum with the ilium and ischium, and often, as in man and most mammals, united also with the ischium to circumscribe the obturator foramen, and, with its fellow of the opposite side, men, and, with its fellow of the opposite side, forming the pubic symphysis. In man each public is united to its fellow in the inedian line at the pubic symphysis, and the two circumscribe the brim of the pelvis in front by their bodies and horizontal rami, their descending rami becoming ankylosed with the lechium to discumscribe the obturator foramen, furnishing bony support to the genitals, and forming part of the inferior strait or guitet of the pelvis. In a few mammals, and in all birds excepting the ostrich, there is no pubic symphysis. A genus of parasitic fungi of the class *Uredinese*; A genus of parasitic fungi of the class Uvedines; the rusts. Plants of this genus exhibit the phenomenon of heterocism—that is, they pass through different stages of their life-history upon different host-plants. P. gramsis, one of the commonest and most destructive species, may be taken as a type. It appears in the spring on the leaves of Berberis vulgaria, constituting what is known a berbering-rust or barberry studer-cups. This is the social stage, and received the name of Moddium Berberidie be-

puccinia on the leaf of a grass; a, one of the uredo-spores; b, of the teleutospores; c, part of the superior face of the leaf of sheets welf-grars, showing the spermognals; c, leaf of Berbertz out-cis, inferior face, showing the accidia; c, transverse section of the of Berbertz will showing the spermognals on the superior of the section on the inferior face; d, the cupales, forming the groups

fore the heteroscism was suspected. Later in the season the unedo stage makes its appearance on the leaves and stems of the cultivated oats, wheat, etc., appearing as pale-yellowish or whitish spots on the leaves. Soon the tissues are ruptured, and the long lines of orange-red unedo-spores are exposed, now constituting the red rust of oats, etc. By the rapid germination of the unedo-spores the disease is quickly spread, and may involve the entire plant. In the fall, just before cold weather, the black teleuto-

spores are produced. This is known as the black rust, and is designed to carry the fungus over the winter, when it again begins its life-cycle on the barberry. About 400 species of Passines are known, not a few of which are serious pests to the agriculturist or horticulturist. See hotercolom, barberry-fungus, rust, Uredinese.

In Aydraul. engin., the operation of working plastic clay behind piling in a cofferdam, the lining of a canal, or in other situation, to prevent the penetration of water; also, the clay or other material used in this operation.—2. The operation of transforming pig-iron into wrought-iron in a reverberatory furnace. The object of pudding is to remove the carbon in the pig-iron; and this is effected partly by the direct action of the origer of the sir at the high temperature employed, and partly by the action of the cinder formed, or the oxidised compounds of iron added during the process. After the iron "comes to nature" in the furnace, it is made up into balls for convenient handling; these are "shingled" by hammering or squeezing, and passed between rolls, by which the metal is made to assume any desired form. There are two methods of puddling; the process as originally performed is called dry puddling; that which is now most generally followed is known as wet puddling, but is oftener called pig-bodling. In the odder process only white or refined iron outle be used; in the newer unrefined iron is employed, and this melts more perfectly and boils up more freely than is the case when refined iron is used, which remains in a more or less pasty condition during the process; hence the name pig-bodling. The puddling process was invented in England by Henry Cort, about 1784, and he was also the inventor of the method of finishing iron by passing it through grooved rolls—processes of immense importance as determining the long-maintained supremacy of England in the iron-manufacturing business. The invention of what is known as "Beasomer steel" has considerably diminished, and is likely still further to diminish, the relative importance of the puddling process which have been invented to make the operation of puddling less futguing for the workmen. Various methods of mechanical puddling, have within the past few years come more or less extensively into use: one is to arrange the tools so as to imitate manu

(a) Properly, a simple machine consisting of a wheel having a grooved rim for carrying a rope or other line, and turning in a frame, which, when movable, is termed a pulley-block.

(b) A block containing several grooved wheels.

(c) A tackle or apparatus consisting of one which, when movable, is termed a puncy-block.

(b) A block containing several grooved wheels.

(c) A tackle or apparatus consisting of one or more pulley-blocks with a rope or ropes reeved through them for use in hoisting. The pulley serves to balance a great force against a small one; its sole use is to produce equilibrium; it does not save work, unless indirectly in some unmechanical way. The pulley is a lever with equal arms; but when it turns, the attachments of the forces are moved. Fig. 1 shows a fixed pulley. The equal settlets of a gree in equilibrium, because they hang from the equal arms of the lever ab, having its faircum at a. Fig. 3 illustrates the principle of the movable pulley. The equal-armed lever, with fulcrum at a, has on one arm the weight d and on the other the force of the stretched string be. If there is equilibrium, this force must be equal to the weight of d. Thus, the total downward pull on f, one arm of the equal-armed lever fy, with fulcrum at h, is twice the weight of d, which must, therefore, be the weight of t to keep it in balance. We may also use the axiom that when a cord is free to move along its length it must be under equal stress in all its parts. Consequently, when a movable block is supported by a number of parallel parts of the same cord,

these must bear equal shares of the load. Thus, in fig. 3, the lower block with the weight b brings equal strains upon four stretches of the cord, one of which is balanced by a. Consequently, the weight of b is four times that of a. But the effects of friction and of the stiffness of the cord are of great importance in the calculation of the advantages of pulleys. There is a great mechanical advantage in having separate blocks for all the movable pulleys, as in figs. 4 and 5. Thus, in fig. 4, the weight a is balanced over the lowest pulley by the pull on b, and the sum of these forces drawing down the lowest pulley is balanced over the second pulley by the pull on c, which is therefore double the weight at b. Thus, by means of four pulleys a balances a + 2a + 4a + 8s = a (24—1), or fifteen times instead of (as by the arrangement of fig. 5. Here, by means of four pulleys, a balances eight times its own weight. Another arrangement is shown in fig. 5. Here, by means of four pulleys, a balances eight times its own weight.

Local, Eng.]—Differential pulley, a peculiar machine operating upon the principle of the lever. Let AD (fig. 1) be a lever, having its fulcrum at C, half-way between A and D. From D and B (a point on AC) cords are attached to the equal arms of the lever EF, with fulcrum at G. Then, if weights are placed on A and G so as to balance one another, G is practically supported at the point half-way between B and D. The ratio of the weight at G to that at A is therefore 2 AC (CD—BC). The differential pulley has above one solid wheel with two grooved rims, the lower one being furnished with spikes to enter the links of a chain and prevent it from running over the wheel (see fig. 2). An endless chain is reeved upon this and upon a pulley below,

8,000 species. By Férussac and many later conchologists the order was extended to include the operculate teniogiosaste and rhipidogiosaste terrestrial gastropods, the true Pulmonata being then called P. inoperculata, and the others P. operculata. This use of the word was long prevalent, but is now obsolete. Also called Pulmonac, Pulmonifera, Pulmonogisteropoda, and Pulmogasteropoda. (b)

2. Specifically, in *physiol.*, the series of rhythmically recurring maxima of fluid tension in any blood-vessel, consequent on the contracmicelly recurring maxima of multi tension in any blood-vessel, consequent on the contractions of the heart. These may be perceived by palpation, and recorded by the sphygmograph, and often produce a visible effect in disting the vessel, or causing a lateral movement of it. The pulse is for the most part confined to the arteries, but a venues pulse occurs (see below). There is one arterial pulse for each ventricular systole; but in disease a ventricular systole may be too feeble to produce a sensible pulsation in a distant artery, as at the wrist, or again each pulsation may be are the times between successive pulsations, the maxima and minima of pressure, and the way in which the tonsion changes from maximum to minimum and to maximum again, represented in the form of the sphygmographic tracing. The normal pulse exhibits approximately equal and equidistant maxims, the rate being in adults between 70 and 30 (see pulse-rate); the rise of pressure is sharp, the fall allow with only a slight distroit wave; the extent of change (amplitude) is not excessive; and the tension of the blood in the vessel is neither too high nor too low. As taken with Basch's sphygonomaximometer, the radial (maximum) tension in health usually lies between 135 and 165 millimeters mercury.

[NL., dim. of L. pulsus, a beating: see pulsel.]

A propulsive filament or flagelliform appendent. dage, as the tail of a spermatozoan, which by its lashing motions propels the body to which it is attached. It is a modified form of flagellum chiefly characteristic of spermatosos, but possessed by some few flagellute infusorians, whose action serves to drive the animalcule backward through the water. E. R. Lankester: W. S. Kent. Compare flagellum, gubernaculum, tractellum.

The flagellum of the Flagellata is totally distinct from the pulsellum of the Bacteria. Encyc. Brit., XIX. 869.
pulse-rate (puls'rat), **. The number of pulsapulse-rate (puls'rāt), **. The number of pulsations of an artery in a minute. The normal pulserate of man in adult life, reclining, and undisturbed by exertion, averages, for the time between breakfast and retiring at night, about 72. There is a large diurnal variation,
the rate failing to 60 or below during the night, and rising
to 75 or more at moon or some other time during the day.
The rate is from 140 to 120 or less during the first year of
life, fails in the next year to 100, and reaches the adult rate
shortly after puberty; after 60 years of age there is a
slight increase. The pulse-rate of woman is 3 to 5 beats
higher than that of man. Height of stature diminishes
pulse-rate. The rate during health varies greatly, from
unknown causes, in different persons—some rates being
40 or less, and others 100 or more, without inconvenience
or other derangement of health. The pulse-rate is higher
in a standing than in a sitting, or, still more, in a recumbent posture. It is raised by excitement, by exertion, by
pyrexia, by various drugs and diseases.

pulse-warmer (puls'war'mer), s. A wristlet. [Collog.]

pulse-wave (puls'wav), n. The wave of raised tension and arterial expansion which starts from the sorts with each ventricular systole, and travels to the capillaries. Its velocity varies greatly, but in most cases lies between 4 and 12 meters per second.—Pundamental or primary pulse-wave, the wave resulting from the primary or ventricular impulse; the wave indicated by the initial Epward stroke of the pulse-curve.—Secondary pulse-wave, a wave following the primary wave, and due to the clastic nature of the arterial walls; a wave indicated by an elevation following the initial upward stroke of the pulse-curve. See pulse!, 2. pulsific (pul-sif'ik), a. [< pulse + -4-fic.] Ex-citing the pulse; causing pulsation. [Rare.]

pulsimeter (pul-sim'e-ter), s. [Also pulsome-ter; \(\) L. pulsus, pulse, + Gr. \(\mu \) roov, measure.] An instrument for measuring the strength or

or instraint for measuring the strength or quickness of the pulse.

pulsion (pul'shom), n. [<LL. pulsio(n-), a heating, a striking, < L. pellere, pp. pulsus, beat, strike, drive: see pulse!.] The act of driving forward: opposed to suction or traction.

How general and ancient seever the common opinion may be that attraction is a kind of motion quite differing from pulsion, if not also apposite to it, yet I confess I concern opinion . . . with some modern naturalists that think attraction a species of pulsion.

Boyle, Cause of Attraction by Suction, i.

The operation of nature is different from mechanism, it doing not its work by trusion or pulsios, by knockings or thrustings, as if it were without that which it wrought upon.

pulsometer (pul-som'e-tèr), π. [< L. pulsus, a beating, + Gr. μέτρον, measure.] 1. Same as pulsimeter.—2. In mech., a kind of steam-con-densing pump acting on the principle of a vacuum-pump. By interposing a stratum of air between the steam and the water it forms a far more economical machine than the old style of vacuum-pump. In the il-lustration s and s' are bottle-shaped chambers; b is the bonnet with

steam-passages; o is a spherical valve which exclude the steam from one commer while permitting it to low into the other. Steam enters at s: d is an industion. d is an induction-passage for water; s and s' are vul-canised rubber valves; f and f, valve-seats; h, the valve-seate; h, the delivery - passage, shown (with other parts) in dutted outline; g and g, eduction - valves for water; f and f, valve-guards; j, an air-chamber; k and k, bonnets covering open.

air-chamber; k and k', bonnets covering openings whereby the valves may be reached for adjustment or repair; l and l', rods which hold the induction-valves and their attachments in place; n and n', brass socket-headed boits which secure the valves g and g' and their attachments in their places. Into the neck of each of the chambers a and a' is screwed a small inlet air-valve (not shown). A similar valve is fitted to the chamber f. Steam entering chamber a gaple its contents, and then, condensing, forms a partial vacuum. The valve then closes the opening into that chamber, and admits steam into the other. Water then rises to fill the vacuous chamber; also a little air enters through the minute air-valve in the neck. By this time the contents of the other chamber are expelled, the steam condenses therein, and other events follow as described for the first chamber. The small quantity of air admitted, being heavier than steam, forms a film over the upper surface of the water, and, being a non-conductor of heat, prevents wasteful condensation of steam, which would otherwise arise from the direct contact of the steam with the water. The machine derives its name from the pulsatory action of the steam ejected, and the analogy of its form, with its interfor valves, to the construction of the heart. Also called agus-meter.

valves, to the construction of the near. Also caused squaremeter.

Pulsus (pul'sus), s. [L.: see pulse.] The pulse.

— Pulsus alternans, a pulse in which alternate beats are strong and weak.— Pulsus higeminus, a pulse made up of cycles consisting of two beats followed by a panse.—

Pultenses (pul-te-né's), n. [NL. (Sir J. E. Smith, 1793), named after Richard Pulteney (1730-1801), an English botanist.] A genus of leguminous shrubs of the tribe Podalyries. It is characterised by united keel-petals, a large banner-petal, two evules, an evate two-valved pod, persistent bractiets closely investing the calys, and dry or thread-like stipules. The 76 species are all Australian. They bear undivided and alternate or rarely whorled fat or concave leaves, and brownish stipules often enlarged to form an involucre under the yellow or orange flowers, which are solitary in the axils or crowded in terminal heads. They are dwarf and ornamental evergreens, usually from 1 to 3 feet high, cultivated chiefly under the name Pulteness; one, P. daphnoides, which reaches 3 feet, is known in Viotoria as scall-flower. pumpkin (pump'kin), n. [Formerly also pumble (and in popular use, though spelled pumpkin, now generally pronounced pung'kin, as if written punkin); an altered form, simulating the term. -kin, of pumpion.] The fruit of a variety of Cucurbita Pepp; also, the plant which riety of Cuourbite Pepo; also, the plant which produces it. The plant is a coarse decumbent vine, often many feet long; the leaves are heart-shaped and somewhat lobed, nearly a foot acroes, and rough and almost prickly, as are also their hollow stalks. The gourd-like fruit is nearly globular or somewhat oblong, flatened at the ends, a foot or more in length, and of a deep orange-yellow color when rips. Inside it is partly filled with a drylah stringy pulp containing the seeds; the esculent part is a fleeby layer an inch or two thick beneath the rind. The pumpkin is of supposed slatic origin, and is cultivated in many countries; in England it has been cultivated either as a curiosity or for food since 1870. It is thought to have been known to the American aborigines, and to have been planted by them among their maise. In America it has been largely given as food to cattle, and is also used on the table, especially in pumpkin-pic; but in culinary use it is now largely superseded by the squash, and is less grown for other purposes than formerly. The pumpkin has various subvarieties, and is closely related to the vegetable marrow. (See secrees!.) The name is sometimes wrongly applied to forms of the aquash. pun² (pun), r.; pret. and pp. punned, ppr. punning. [Usually explained as a particular use of pun¹, pound, as if to pound or beat words, as it were into new shapes (cf. twist, wrest, as used of words; clench, clinch, a pun); but this explanation requires the verb to have been orig. transitive, 'to pound' (sc. words); evidence of such a use is lacking, and it is not certain that the verb precedes the noun.] I. intrans. To make puns.

Dryden, tr. of Juvenal, z. 189.

II. trans. To affect by a pun.

The sermons of Bishop Andrews and the tragedies of Shakspeare are full of them | puns|. The sinner was punsed into repontance by the former, as in the latter nothing is more usual than to see a hero weeping and quibbling for a dozen lines together.

Addison, Spectator, No. 61.

pun² (pun), n. [See pun², v.] An expression in which the use of a word in two different applications, or the use of two different words pro nounced alike or nearly alike, presents an odd or ludierous idea; a play on words that are alike or nearly alike in sound but differ in meaning; a kind of verbal quibble.

A gass can be no more engraven than it can be translated. When the word is construed into its idea, the double meaning vanishes. Addison, Ancient Medals, it.

A better pus on this word (gay) was made on the Begar's Opera, which, it was said, made Gay rich, and Eich w. Walpole, Auccdotes of Painting, V. 92, note. - Byn. Pun, Paranomasia, Assonance. Pun and para-nomasia are often confounded, but are in strictness dis-Normand are often connected, but as all any upon two senses of the same word or sound, and its effect is to excite a sense of the ludierous: as,

They went and told the sexton, and
The sexton told the bell.
Hood, Sally Brown.

Even when taken into sober discourse, the pus has an effect at least of oddity: as,

For Sufalk's duke, may he be suffered to.

Shak., 2 Hen. VI., i. 1. 124.

Hence modern taste excludes puns from serious writing and speaking. Paronomasta is rather the use of words that are nearly but not quite alike in sound, and it heightens the effect of what is said without suggesting the ludicrous: a. "Per sugusta at sugusta"; "And catch with his surcease success," Shak., Macboth, i. 7. 4;

To begirt the almighty throne Besecking or besieging. Millon, P. L., v. 869.

As in these examples, it is most likely to be used where the words thus near in sound are far apart in meaning. It is very common in the original languages of the Biblo, especially in the Old Testament, as in Isa. v. 7. An attempt to imitate it may be found in Mat. xxi. 41, revised version. Assumance is the bare fact of resemblance of cause disagreeable to the ear: as, unfold old truths, our procest, if of, is as, and Andrew drew, the then condition. For the technical meaning of assonance, see def. 2 under that word.

Nums. (Pi'nk). 2. [Parity.] In the Parity is the words.

1. To make a hole or holes in with a punch or some similar instrument; pierce; perforate: as, to punck a metal plate.

When I was mortal, my anointed body By thee was punched full of deadly holes. Shak., Rich. III., v. 8, 125.

2. To make with or as with a punch: as, to punch solid material, or to drive out or in objects inserted in previously formed perforations or

solid material, or to drive out or in objects inserted in previously formed perforations or cavities. The pointed punch may be regarded as a chisel with a very narrow edge, cutting, therefore, in one point only, and forcing adjacent parts of the material asunder by a wedge-like action. The section of a punch with a continuous edge findlosing an area is also analogous a specific or a punch of a chisel. The section of a flat-nosed punch, when used with a die to which it is fitted, is that of a shear-blade, the parts of the material operated upon being separated by sliding over each other, instead of being wedged apart, as is the operation of the pointed punch. Hardened and tempered steel is the usual material of which punches are made. Solid punches with engraved faces are used for simpling-dies, as in codning, and with plain flat faces are used in connection with scurately litted dies for making clean-cut holes in metal plates, and also for punching out blanks for buttons, coins small gear-wheels, etc. Hollow punches, or punches having continuous edges inclosing an area, are principally used for cutting either very thin, soft sheed-metal, as ith, brasa, or copper plates, or other soft flexible substances, as leather, paper, or cloth. The pointed punch is used for marking centers in the operation of turning, or for punching holes in thin materials where clean cutting is of no importance, as in punching holes in sheet-sinc or tim for the reception of nafis in nailing such sheets to wood.

ponctuation, < ML. punctuatio(n-), a marking with points, a writing, agreement, < punctuare, mark with points, settle: see punctuate.] 1. In writing and printing, a pointing off or separation of one part from another by arbitrary marks; specifically, the division of a composition into septences and parts of sentences by the use of specifically, the division of a composition into sentences and parts of sentences by the use of marks indicating intended differences of effect by differences of form. The points used for punctation exclusively are the period or full-stop, the colon, the semicolon, and the comma. (See point, a, 11 (s.)) The interrogation- and excismation-points serve also for punctuation in the place of one or another of these, while having a special rhetorical effect of their own; and the dash is also used, either alone or in conjunction with one of the preceding marks, in some cases where the sense or the nature of the pauso required can thereby be more of punctuation was gradually developed after the introduction of printing, primarily through the efforts of Alwards was at first run together continuously; afterward they were separated by spaces, and sometimes by dots or other marks, which were made to serve some of the purposes of modern punctuation, and were retained in early printing. Long after the use of the present points became established, they were so indiscriminately employed that, if closely followed, they are often a hindrance rather than an aid in reading and understanding the text. There is still much uncertainty and arbitrarines in punctuation, but its chief office is now generally understood to be that of facilitating a clear comprehension of the sense. (See punctuation, characterized especially by the use of many commas, was common in English in the eighteenth century, and is the rule in present French usage; but open punctuation, characterized especially by the use of many commas, was common in English in the eighteenth century, and is the rule in present French usage; but open punctuation, characterized by the avoidance of all pointing not clearly required by the construction, now prevails in the best English usage. In some cases as in certain legal papers, title-pages, etc., punctuation as a polication of sentences and parts of sentences by the use of

1. The orifice of the iris; the hole or opening in the iris through which light passes. The pupil appears usually as a black spot in the middle of the colored part of the eye, this appearance being due to the darkness of the back of the eye. The pupil contracts when the retina is stimulated, as by light, on accommodation for near distances and on convergence of the visual axes; pain may cause a dilatation. The size of the pupil is determined by the circular and radiating muscular fibers of the iris. It may also be influenced by drugs; thus, opium contracts and beliadonna dilates the pupil. The same consequences may result from disease or injury. The shape of the pupil is most animals is circular, as the expression of the uniform action of the contractile fibers of the iris; but in many animals it is oval, elliptical, or slithing the horse is a broad, nearly parallel-sided fissure obtasely rounded at each end. The variability of the pupil in size is not less remarkable in owls than in cata, but in these birds it keeps its circular figure, changing in size from a mere point to a disk which leaves the iris a mere from. T. Burnet, Theory of the Earth.

The act of cleansing from the imputation of guilt; specifically, in old law, the clearing of one's self from a crime of which one has been one's sent from a crime of when one has been publicly suspected and accused. It was either canonical (that is, prescribed by the canon law, the form whereof used in the spiritual court was that the person suspected took his oath that he was clear of the facts objected against him, and brought his honest neighbors with him to make oath that they believed he swore truly) or walgar (that is, by fire or water ordeal, or by combat). See ordeal.

She was always an honest, civil woman; her neighbours would have gone on her *purgation* a great way. Latimer, 5th Sermon bef. Edw. VI., 1549.

The inquisitors had a discretion to allow the accused to make the canonical purposion by eath instead of undergoing corporal texture, but the rule which allows this to be done at the same time discountenances it as fallacious.

2. [cap.] One of a class of Protestants which arose in England in the sixteenth century. The Puritans maintained a strict Calvinism in doctrine, and demanded, in opposition to those who desired a reform of the church service, the substitution of one from which should be banished all resemblance whatever to the forms of the Roman Catholic Church. Large numbers of them were found both in and out of the Church of England, and various repressive measures were directed against them by the sovereigns are by the prelates Parker, Whitgift, Bancroft, Land, and others. In the reign of Charles I, the Puritians developed into a political party and gradually gained the ascendance, but host it on Crouwell's death, and after the Restoration ceased to be prominent in history. During their early struggles many of them emigrated to Now England, especially to the Massachusetts Bay Colony. One band of Puritians who separated on them came the founders of the Plymouth Colony, often called Pilyrim Pathers or Plygrims.

Parsons may be ranked among the earliest writers of our vernacular diction in its purity and pristine vigor, without ornament or polish. I. D'Israeli, Amen. of Lit., II. 85.

In our own tongue we may err egregiously against pro-priety, and consequently against purity, though all the words we employ be English, and though they be con-strued in the English idiom. The reason is evident: they may be misapplied; they may be employed as signs of things to which use hath not affixed them. This faul may be committed either in single words or in phrases, G. Campbell, Philosophy of Khetoric, II. iii. § 8.

Our verse . . . had become lux and trivial, and we needed to be recalled to precision and moral vigor.

L. putrefactio(n-), C. L. putrefacere, pp. putrefactus, putrefy: see putrefy.] 1. The act or process of putrefying; the decomposition of animal and vegetable substances, attended by the evolution of fetid gases. Putrefaction is at present believed to be a result of the activity of organisms of the simplest form—the Schizonyoster. It can therefore take place only when the conditions are favorable for the life and growth of these organisms. A temperature of from 00 to 80° F., a moderate degree of humidity, and limited access of air are the conditions most favorable to putrefaction. Extremes of heat and cold, alt, sugar, vinegar, carbolic acid, corrosive sublimate, and other antiseptics prevent putrefaction by destroying or rendering inactive the organisms which induce it. The chemical changes in a putrefying body are most complex. From proteid bodies are formed leucin, tyroain, a considerable number of alkaloida, the ptomaines, compound ammonias, hydrogen sulpilid, and many other solid and gaseous products. See fermentation, and germ theory (under germ).
